1 SUMMARY

This report is an independent technical review of the geology, exploration and current mineral resource estimates for the Tuvatu Gold Project in Fiji, recently completed for Lion One Metals Limited (Lion One), which is a public company jointly listed in Canada and Australia (TSX-V: LIO, ASX: LLO).

The Tuvatu Gold Project including the Tuvatu gold deposit consists of three tenements held by Lion One Limited, a subsidiary company of Lion One Metals Limited. The tenements are located in the upper reaches of Sabeto Valley approximately 24 km north east of Nadi on the west coast of Viti Levu, and 15 km from the Nadi International Airport (Figure 1).

Figure 1: Project Location

Local host lithologies in the Tuvatu area are a sequence of volcanoclastic units intruded by a monzonite intrusive complex. Gold mineralization is dominantly hosted in the monzonite units but also occurs in the adjacent volcanics. Mineralization is structurally controlled and is considered to have a close association with the emplacement of the monzonite intrusive body occurring as sets and networks of narrow veins and cracks, with individual veins as modelled in this study ranging from 0.04 to 9 m true width with a mean of 1.1 m. Lode mineralogy is varied, with most veins containing quartz, pyrite and base metal sulphides. A very high proportion of the gold in the deposit occurs as either free gold or is contained in quartz or pyrite grains that can be extracted by simple floatation followed by cyanidation. Free gold present is both fine and coarse grained although sample assay repeatability is very good suggesting most is fine grained. Mineralization is clean with respect to deleterious elements such as arsenic, selenium, and uranium.

The main mineralized zone (Upper Ridges) comprises eleven principal lodes with a strike length in excess of 500m and a vertical extent of more than 300 m (Figure 2). Another major zone of mineralization (Murau) strikes east-west and consists of two major lodes with a mapped strike length in excess of 400 m. A total of 39 different lode structures were identified in the resource area

including 11 lodes in the Upper Ridges area, 3 lodes in the Murau area, 4 lodes in the West area, 2 lodes in the Tuvatu area and stockwork veins in the SKL area. A minimum of 5 intercepts are needed for a vein to be defined with a number of other lodes having been identified but remain to be further tested before inclusion in resource estimates.

Figure 2. Tuvatu Lodes (Oblique view (45°E -45°))

The resource has been estimated for each vein individually using Ordinary Kriging of width and grade, the latter using accumulations, into a 3D block model.

The Tuvatu resource is reported at two cut offs representing resources amenable to open pit and underground production. The total indicated resource is 1,448,000 tonnes at 6.9 g/t Au for 320,000 ounces of gold and an inferred resource of 1,791,000 tonnes at 8.4 g/t Au for 485,000 ounces of gold (Table 1).

Table 1: 2014 Tuvatu Resource Estimate

Cut off	Selection Criteria	Resource Category					
		Indicated			Inferred		
		Tonnes t	Grade Au g/t	Ounces Au oz	Tonnes t	Grade Au g/t	Ounces Au oz
1 g/t Au	Surface Mining Potential - Within 75m of surface	609,000	3.5	69,000	513,000	4.2	69,000
3 g/t Au	Underground Mining Potential - Below 75m of surface	839,000	9.3	251,000	1,278,000	10.1	416,000
Total		1,448,000	6.9	320,000	1,791,000	8.4	485,000

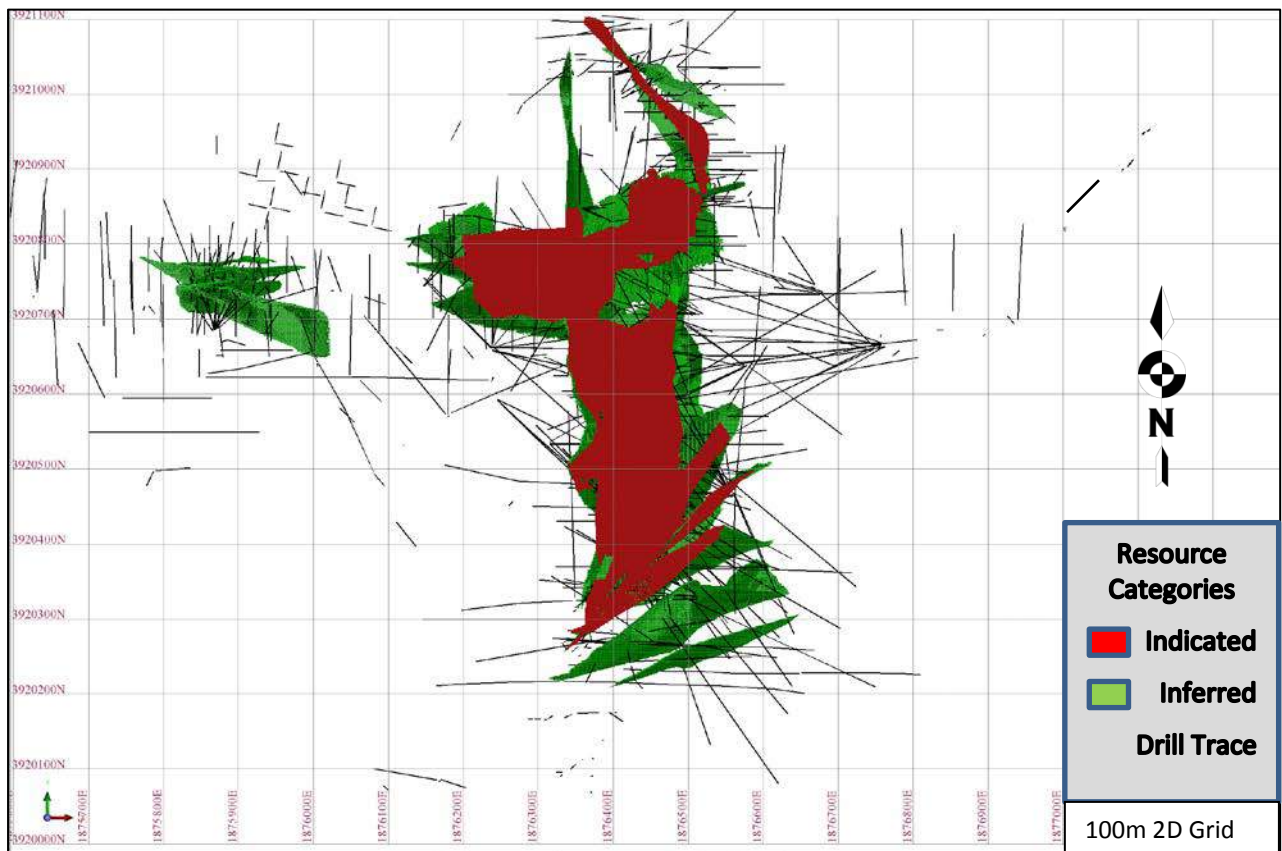

Figure 3: Plan View of Lodes Colour Coded for Resource Category with Drilling.

A total of 1,341 m of decline, strike and rise development have also been undertaken in the project area including a 600m exploration decline. The resource has been depleted by a total of 3500 tonnes at 9.06 g/t Au (1,020 oz Au). No detailed historical production records are available.

The resource has been reported at various cut off grades to provide insight into the sensitivities of the resource (Table 2). Reporting all material above a cut off of 3 g/t Au provides an indicated resource of 1,101,000 tonnes at 8.46 g/t Au for 299,500oz and an inferred resource of 1,506,000 tonnes at 9.7 g/t Au for 468,000 ounces of Au.

Table 2: Tuvatu Resource Reported above various cut-offs

Cut-Off g/t	Indicated			Inferred		
	material (t)	Au (g/t)	Au (oz)	material (t)	Au (g/t)	Au (oz)
1.0	1,943,000	5.61	350,300	3,022,000	5.8	561,000
2.0	1,435,000	7.07	326,200	2,156,000	7.5	520,000
3.0	1,101,000	8.46	299,500	1,506,000	9.7	468,000
5.0	683,000	11.25	247,000	872,000	13.9	390,000

The summary review of geology, resource models and estimates and the site visit were conducted by Mr Ian Taylor, BSc (Hons) MAusIMM (QP) who visited the site from the 25th to 28th February 2014. Mr Taylor viewed the geological setting, located some drill collars, inspected drill core, and sample storage.

Mr Taylor has sufficient experience which is relevant to the Tuvatu style of mineralization and deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (Australia) and is a Qualified Person as defined in NI43-101 (Canada). He is a Member and certified professional of The Australasian Institute of Mining and Metallurgy (Melbourne). Mr Taylor is employed by Mining Associates Pty Ltd of Brisbane, Australia.

The following recommendations have been made after this review of the technical data on the Tuvatu Gold Project:

- Continue exploration work, both surface channel sampling and mapping, particularly in areas where veins outcrop, and areas amenable to open pit mining.
- As Lion One intends to develop a mine at the Tuvatu Project, exploration drilling should continue at a measured pace to improve understanding of veins locations and local structural complexity.
- Dewater the decline
- Emperor completed a feasibility study in 2000. Lion One should update the financials and finalise the approvals process with the MRD.

Anthony Woodward, B.Sc (Hons), M.Sc
Ian Taylor, B.Sc (Hons)

Brisbane, Australia

Effective Date: 6 May 2014

2 INTRODUCTION

2.1 ISSUER

This report is an independent technical review of the geology, exploration and current mineral resource estimates for the Tuvatu Gold Project in Fiji.

At the request of Mr Stephen Mann, Managing Director of Lion One Metals Limited (“Lion One”), the issuer, Mining Associates Pty Ltd (“MA”) was commissioned on 21 February 2014 to prepare an Independent Technical Report on the resources at the Tuvatu Gold Project.

MA has not been requested to provide an Independent Valuation, nor has MA been asked to comment on the Fairness or Reasonableness of any vendor or promoter considerations, and therefore no opinion on these matters has been offered.

2.2 TERMS OF REFERENCE AND PURPOSE

Lion One Metals Limited intends that this report be used as an Independent Technical Report as required under Part 4 “Obligation to File a Technical Report”, of Canada’s National Instrument 43-101 Standards of Disclosure for Mineral Projects (“NI43-101 Standards”).

At Lion One Metals Limited’s request, MA’s report includes:

- A new resource model encompassing all mineralized veins at the Tuvatu Gold deposit
- An updated resource estimate for the Tuvatu Gold deposit.
- A report that satisfies Part 4 Section 4.2 of Canada’s National Instrument 43-101 Standards of Disclosure for Mineral Projects.

2.3 INFORMATION USED

This report is based on technical data provided by Lion One Metals Limited to MA. Lion One Metals Limited provided open access to all the records necessary, in the opinion of MA, to enable a proper assessment of the project and resource estimates. Lion One Metals Limited has warranted in writing to MA that full disclosure has been made of all material information and that, to the best of the Lion One Metals Limited’s knowledge and understanding, such information is complete, accurate and true. Readers of this report must appreciate that there is an inherent risk of error in the acquisition, processing and interpretation of geological and geophysical data, and MA takes no responsibility for such errors.

Additional relevant material was acquired independently by MA from a variety of sources. The list of references at the end of this report lists the sources consulted. This material was used to expand on the information provided by Lion One Metals Limited and, where appropriate, confirm or provide alternative assumptions to those made by Lion One Metals Limited.

Three weeks were spent on data collection and analysis and preparation of this report.

Geological information usually consists of a series of small points of data on a large blank canvas. The true nature of any body of mineralization is never known until the last tonne of ore has been mined out, by which time exploration has long since ceased. Exploration information relies on interpretation of a relatively small statistical sample of the deposit being studied; thus a variety of interpretations may be possible from the fragmentary data available. Investors should note that the statements and diagrams in this report are based on the best information available at the time, but may not necessarily be absolutely correct. Such statements and diagrams are subject to change or refinement as new exploration makes new data available, or new research alters prevailing

geological concepts. Appraisal of all the information mentioned above forms the basis for this report. The views and conclusions expressed are solely those of MA. When conclusions and interpretations credited specifically to other parties are discussed within the report, then these are not necessarily the views of MA.

2.4 SITE VISIT BY QUALIFIED PERSONS

The summary review of geology and resource models and estimates and the site visit was conducted by Mr Ian Taylor, BSc (Hons) MAusIMM (QP) who visited the site from the 25th to 28th February 2014. Mr Taylor viewed the geological setting, located some drill collars, inspected drill core, and sample storage.

Mr Taylor has sufficient experience which is relevant to the Tuvatu style of mineralization and deposits under consideration and to the activity which he is undertaking to qualify as a Qualified Person as defined in NI43-101 (Canada). He is a Member of The Australasian Institute of Mining and Metallurgy (Melbourne). Mr Taylor is employed by Mining Associates Limited of Brisbane.

3 RELIANCE ON OTHER EXPERTS

MA has assumed, and relied on the fact, that all the information and existing technical documents listed in the References section of this report are accurate and complete in all material aspects. While we carefully reviewed all the available information presented to us, we cannot guarantee its accuracy and completeness. We reserve the right, but will not be obligated to revise our report and conclusions if additional information becomes known to us subsequent to the date of this report.

In general, copies of the tenure documents, operating licenses, permits, and work contracts were not reviewed and an independent verification of land title and tenure was not performed. MA has not verified the legality of any underlying agreement(s) that may exist concerning the licenses or other agreement(s) between third parties.

Land tenure and other select technical data as noted in the report were provided by Lion One and MA has relied on the integrity of such data.

A draft copy of the report has been reviewed for factual errors by the client and MA has relied on Lion One's knowledge of the Property in this regard. All statements and opinions expressed in this document are given in good faith and in the belief that such statements and opinions are not false and misleading at the date of this report.

4 PROPERTY DESCRIPTION AND LOCATION

4.1 PROPERTY AREA

Title to three Special Prospecting Licences (total area 10,565 ha) is held by Lion One Limited, a subsidiary company of Lion One Metals Limited (Table 3, Figure 4). The status of the tenements has not been independently verified by MA, letters from the Mineral Resources Department, Fiji to Lion One Limited have been viewed.

Table 3: Tuvatu Tenement Details

Tenement Number	Area hectares	Annual Expenditure Required	Date of Grant	Term	Interest
SPL1283	1,951	FJD\$700,000	Sept. 19, 2013	July 1, 2013 to June 30, 2016	100%
SPL1296	1,315	FJD\$700,000	Sept. 19, 2013	July 1, 2013 to June 30, 2016	100%
SPL 1465	8,900	FJD\$600,000	Dec. 23, 2013	Dec 2, 2013 to Dec 1, 2016	100%

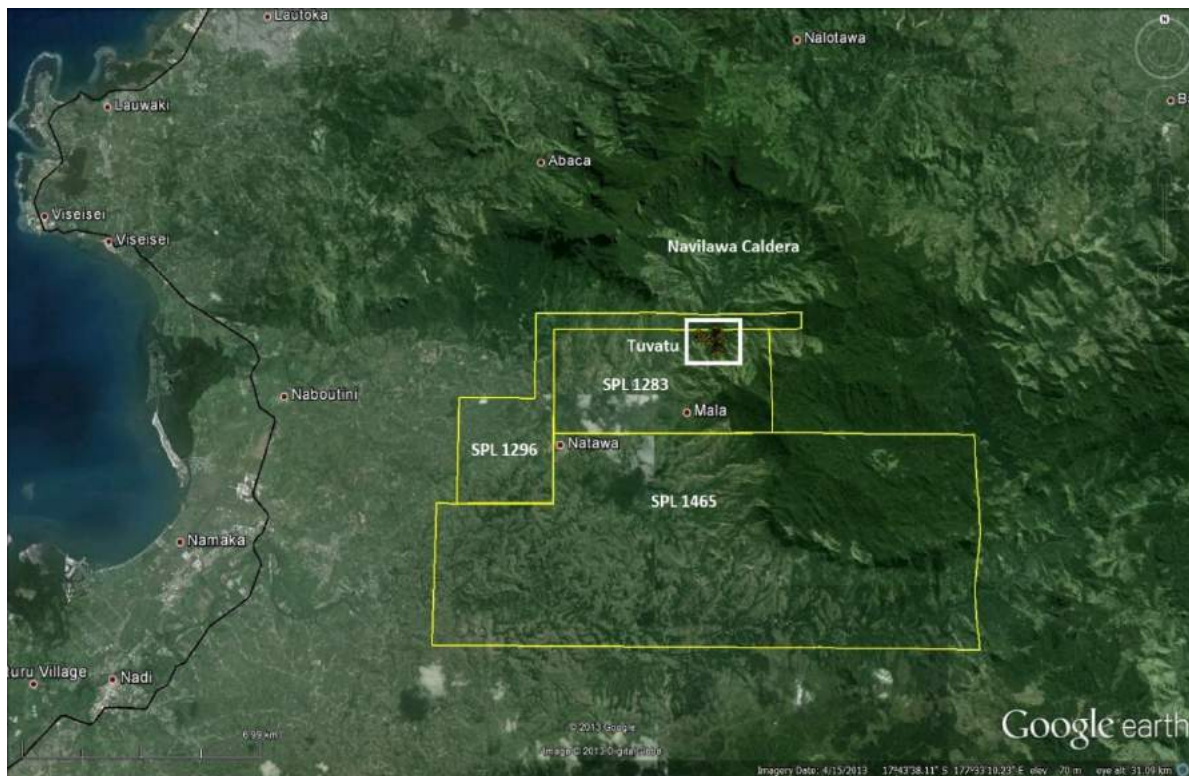

Figure 4: Project Location (Source: Lion One Metals, 2014)

4.2 PROPERTY LOCATION

The tenements are located in the upper reaches of Sabeto Valley approximately 24 km northeast of Nadi on the west coast of Viti Levu, and 15 km from the Nadi International Airport. The Tuvatu gold deposit is located within SPL1283, the portal lies within SSPL1296. SPL1465 is a contiguous lease with the existing Tuvatu leases extending to the south to cover additional prospective geology and to cover the area that was previously demarcated for a tailings dam by Tuvatu Gold Mines (TGM) in its 2000 mining study.

MA has not undertaken any title search (other than viewing on-line government tenement map databases) or due diligence on the tenement titles or tenement conditions and the tenement's status has not been independently verified by MA.

4.3 PROPERTY OWNERSHIP, RIGHTS AND OBLIGATIONS

Title to the property is held by Lion One Limited, a subsidiary of Lion One Metals Limited.

There are three types of land in Fiji; native land, crown land and freehold land. The project area lies mostly, if not all, within native land, classified as native reserve land. This means that Lion One has to acquire consent through signatures of a minimum of 75% of adult members of the Land Owning Unit ("LOU") for the land to be de-reserved. Lion One must then negotiate for a land lease that will require the consent of 50% of adults in the LOU.

There are also native Fijian leaseholders in the project area with whom Lion One must consult in its acquisition plans. Compensation agreements must be finalized with these leaseholders to gain access to their lease areas.

All land covered by the SPLs is native land which comes under the control of the Native Land Trust Board (NLTB) on behalf of the native owners. About 5% of the SPLs are under cane lease, through the Agricultural Land and Tenants Act (ALTA).

Native land is vested in the NLTB under the Native Land Trust Act which means that only the NLTB may grant any legal interest in native land. Most, if not all, the land required by Lion One for its mining tenements and native leases are within native land reserve which cannot be leased out to any non-Fijian unless such land is de-reserved.

4.4 ROYALTIES, AGREEMENTS AND ENCUMBRANCES

To the extent known by MA, there are no option agreements or joint venture terms in place for the property.

To the extent known by MA, there are no known obligations on ground covered by claims comprising the property.

To the extent known by MA, the company does have up to date compensation agreements with the native title landowners (Lion One, 2013).

4.5 ENVIRONMENTAL LIABILITIES

To the extent known by MA, there are no known environmental liabilities on the property.

4.6 REQUIRED PERMITS FOR EXPLORATION WORK

In Fiji the investor's right to continue exploration/development programs is written in the Mining Act. The guiding principle of Fiji's mineral investment policy is that Government assumes that the grant of an exploration licence implies a right to proceed to eventual project development. This is subject to the licence holder maintaining a vigorous geological and/or feasibility study program approved by the Minister responsible for Mineral Resources.

4.7 OTHER SIGNIFICANT FACTORS AND RISKS

To the extent known by MA there are no other significant factors and risks that may affect access, title, or the right or ability to perform work on the property.

5 ACCESSIBILITY, CLIMATE, LOCAL RESOURCES, INFRASTRUCTURE AND PHYSIOGRAPHY

5.1 ACCESS

Tuvatu lies on the west coast of Viti Levu, 24 km northeast of Nadi town and approximately 15 km by road from the Nadi international airport. The area is steep and rugged, and access is via the Sabeto Road which is sealed for about half the journey.

The Sabeto road turnoff is located approximately 10 minutes north of the Nadi International Airport. The Sabeto road follows the Sabeto River on its western side. The electricity pylons of the Monasavu Hydro line can be seen. Further along the Sabeto road, the road forks, with the left fork going to Korobebe village, and on to Navilawa village. Tuvatu is located on the road to Navilawa.

SPL1283 and SPL1296 cover land areas in the upper catchment of the Sabeto River immediately south of Navilawa village. The tenements are bounded to the southeast by the Namotomoto ridge. Nagado village is located on this ridgeline. The Korobebe village is located on the banks of the Sabeto River about 4 km southwest of the Tuvatu prospect and further downstream are the villages of Naboutini, Koroyaca and Sabeto. On the opposite side of the river from Sabeto village is Natalau village. Indian cane farmers lease the land in between the Fijian villages.

Nadi is the closest city and is serviced by direct daily flights from Brisbane, Melbourne, Sydney and Auckland by several Australian airlines. Tuvatu is readily accessed from Nadi International Airport by the Sabeto Road. A network of local formed roads and pastoral tracks provides good access to most of the project area. During the wet season (November to March), major and minor creeks may be impassable for some days. In wet weather, four wheel drive vehicles are required to access the tenements. Creeks and adjacent areas are generally thickly vegetated while the spurs and ridges are dominated by open grasslands.

5.2 CLIMATE

Fiji experiences a mild tropical South Sea maritime climate without great extremes of heat or cold. Winds are generally light to moderate and blow from E-SE during all seasons. Temperatures average 22°C for the cooler months (May to October) while November to April temperatures are higher with heavy downpours.

The islands lie in an area occasionally traversed by tropical cyclones. These are mostly confined to the period November to April, with greatest frequency around January and February. On average, some ten to twelve cyclones per decade affect some part of Fiji, with two or three causing severe damage. Specific locations may not be directly affected for several years but the dominant north-west tracks give some increased risk of damage in the outlying north-west island groups.

Viti Levu's climate is dominantly controlled by oceanic temperatures and winds, restricting the diurnal temperature range heavily and the average daily range is 8.5°C to 10.3°C. Average minimum temperatures for Nadi range from 18°C to 23°C while average maximums range from 28°C to 32°C; it can be expected that these are a good guideline for the Tuvatu area, given its close proximity to Nadi. Mean rainfall in the area varies from 50 mm in July to a high of 300-325 mm during the December to March wet season.

5.3 LOCAL RESOURCES

Tuvatu is located within the upper reaches of the Sabeto Valley. The area hosts a number of small villages that are dependent on the local waterways (e.g. Sabeto River) to supply water for local sustainable agricultural practices such as sugar cane, coconut oil and fruits and vegetables. English is

the official language. However, Fijian and Hindi are also taught in schools as part of the school curriculum.

The major towns in close proximity to the Tuvatu area are Lautoka, Nadi and Ba (Table 4). Lautoka, Fiji's second-largest city, is located 30 km from Tuvatu. The local economy still relies heavily on the sugar industry and the Lautoka Sugar Mill has been operating since 1903. Nadi is Fiji's third-largest city and a tourist and business hub due to the presence of the Nadi International Airport.

The major land use in the Tuvatu region is pastoral, with most income generated from sugar cane, copra and rice production. Fishing, manufacturing and tourism industries are also employers in the region. Any skilled workforce for a mining development in the region would be expected to be drawn from coastal Nadi-Lautoka-Ba region. There are also experienced former mine workers from the Vatukoula Gold Mine.

Table 4: Population Centres (2007)

Town	Population	Principal Activity
Lautoka	52,220	Agriculture, tourism, fishing
Nadi	42,284	Tourism, manufacturing
Ba	18,526	Agriculture, fishing, mining

(Source: Fiji Bureau of Statistics)

5.4 INFRASTRUCTURE

Fiji is one of the most developed of the Pacific island economies, although a large subsistence sector still exists. Sugar exports, remittances from Fijians working abroad, and a growing tourism industry (with 400,000 to 500,000 tourists annually) are the major sources of foreign exchange. Sugar processing makes up one-third of industrial activity.

Little infrastructure exists within the local area proximal to the Tuvatu project other than a small exploration facility. Local villages utilise a combination of traditional and modern practices but do not contain any significant infrastructure. The majority of regional infrastructure, such as transport, telecommunication and energy revolve around the nearby cities of Nadi and Lautoka.

Nadi is equipped with modern technology for both its internal and international telecommunications. All major towns have digital telephone exchanges and the islands are linked by cable and satellite to worldwide networks. The project area is covered by GSM mobile-phone reception.

The Fiji Electricity Authority ("FEA") holds the monopoly in all facets of the energy sector including generation, transmission and distribution. Hydroelectric and diesel are the two sources of power generation for the FEA. Its supply capacity currently stands at 180 megawatts, however rising use of electricity has prompted government to call for submissions from independent power producers. The FEA has an 11 kV line at Korobebe village, which could supply 2 MW of power. This line could be upgraded by the Fiji Electricity Authority to 33 kV from the Sabeto turn-off to the mine site. The villages around Tuvatu chiefly utilise fuel wood and small diesel generators.

5.5 PHYSIOGRAPHY

The upland areas of the Tuvatu project area are grassland. Stream valleys and their perimeters are heavily vegetated. Several intermittent and perennial streams are located within the prospecting licenses. Elevation of the Tuvatu property ranges from 50 m to a maximum of 700 m. The area is hilly with slopes of 15%-30 % being common.

6 HISTORY

6.1 PREVIOUS OWNERSHIP

Historical activities began during the early part of the 20th century with prospecting in the upper reaches of the Sabeto River with no evidence that the mineralized lodes at Tuvatu were discovered. Some pitting and limited underground work took place between 1945 and 1952 when Bayley and Bryant operated PL 689. Later work in the area was undertaken by the Nadele Syndicate.

In the period from 1977 to 1979 Aquitaine Fiji explored the Tuvatu area. In 1987, Geopacific Ltd pegged out SPLs 1283 and 1296. During the next ten years, Geopacific Ltd invested approximately \$1.5M in exploration at Tuvatu. For three of these years, Geopacific Ltd was in association with Noranda Pty Ltd. In December 1995, Geopacific Ltd entered into an option agreement with Emperor Mines Ltd. and in June 1997, Emperor exercised its option to purchase 100% of the tenements. Emperor then incorporated the Tuvatu Gold Mining Company Limited (“TGM”), a subsidiary of Emperor Gold Mining Company, to manage the property.

In 2007 following the closure of the Vatukoula gold mine Emperor Gold Mining Company (at the time a subsidiary of DRD Ltd), sold its Fijian assets including the Tuvatu property to Westech Gold Pty Ltd and Red Lion Management Ltd. Licenses covering the Tuvatu property were re-issued in the name of Lion One by the Fijian Government. Subsequently American Eagle Resources gained control of Lion One Limited, the holder of the Tuvatu project. Lion One Metals is the product of the reverse takeover in January 2011 of X-Tal by American Eagle Resources.

6.2 PREVIOUS EXPLORATION

All historical work described in this section was conducted within the tenements currently held by Lion One Limited.

6.2.1 Tuvatu Project Area

Some pitting and limited underground work was undertaken by Bayley and Bryant between 1945 and 1952 when they operated PL 689. Later geological work undertaken by the Nadele Syndicate included the pitting of two lodes, trenching and driving an adit but no records of the syndicate’s work have been located.

Aquitaine Fiji explored the area from 1977 to 1979 and located a soil anomaly of 1.4g/t Au, which was not pursued. In 1987, Geopacific Ltd pegged out SPLs 1283 and 1296 in the area and investigated the soil anomaly previously identified by Aquitane Fiji. Geopacific discovered the outcrop of what is now called the Tuvatu lode in the vicinity of the soil anomaly.

From 1995 to 2001 TGM conducted 3 phases of exploration at Tuvatu. The Phase 1 programmes carried out between April 1996 and February 1998, involved initial regional geological mapping and stream sediment sampling which located the Tuvatu gold deposit in the SKL-Nasivi area. A number of geophysical surveys were also completed including a dipole-dipole IP survey and airborne magnetics/radiometrics survey. Phase 2 followed in March 1999 with subsurface exploration and development, including limited trial mining and metallurgical testing.

Phase 3 commenced in 2000 with work on a feasibility study but the study was suspended in late 2000 as part of a general cost-cutting exercise by Emperor due to the low gold price at the time.

The Phase 3 evaluation of the Tuvatu resource area included surface diamond and percussion drilling to test some peripheral anomalies as well as down-dip extensions of the various Upper Ridges lodes. The program included mine and metallurgical design, environmental plans and social acceptance

issues. In addition, re-mapping of the underground development took place in order to develop a robust structural model for the area. Further metallurgical test work was also completed.

Overall there have been three programs of drilling at Tuvatu from exploration through to resource delineation. Drilling has been completed both on the surface and from the underground exploration decline. Drilling methods included both diamond drill (DD) and reverse circulation (RC).

In total TGM completed 51,484m of diamond core drilling and 9,265m of RC surface drilling, as well as 13,407m of underground drilling. A total of 1,341 m of decline, strike and rise development was also been undertaken in the project area including a 600m long exploration decline developed to a depth of 240m below surface in the region of the Upper Ridges lodes.

6.2.2 Regional Exploration

Only limited regional exploration had been carried out in the area by explorers (primarily Aquitaine Fiji) before TGM's work. In the 2001-2003 period a regional exploration program was carried out by TGM that involved regional mapping, trenching, stream sediment and soil sampling. This work identified more than 10 new prospect areas outside the Tuvatu mine area.

Detailed exploration was carried out by TGM at Nubunidike, Ura Creek, Jomaki, Malawai, and Kubu prospects. The Nubunidike and Ura Creek prospects were the most advanced prospects. Exploration work commenced at Qualibua in June 2002. Subsequent ridge and spur soil geochemistry located high tenor gold-in-soil anomalies at the Korobebe prospect.

Upon gaining control of the Tuvatu property Lion One commenced detailed mapping and geochemical sampling. Work concentrated on the region south of the Tuvatu resource area and around Qalibua Creek to the north. Two surface diamond drillholes were completed in October 2008 at the Nubunidike prospect to test the Nubunidike/Hornet Creek/290 Vein system.

6.3 HISTORIC RESOURCE AND RESERVE ESTIMATES

A number of historical mineral resource estimates were carried out at Tuvatu by previous operators over the period from 1997 to 2000.

6.3.1 TGM 1997 Upper Ridges Resource

A resource figure was calculated internally by TGM in September 1997 for the Upper Ridges area as 904,000 tonnes @ 5.1 g/t Au (149,272 ounces). This was a vein-style polygonal estimate with 25 m radius polygons being drawn on long sections in the plane of each hole. No lower cut-off was applied.

6.3.2 TGM 1998 Upper Ridges Resource

The resource was updated using similar methodology in February 1998. Using a lower cut-off for each intersection of 2 m-grams, a boundary was drawn around all intersections greater than 2 m-grams. Continuity of veining beyond 25 m was assumed where no conflicting evidence occurred. Equal weighting was given to each intersection within the model boundary of the lode when calculating average width and average grade of the lodes. A density of 2.7 g/cm³ was used. An overall resource figure for the Upper Ridges lodes of 602,000 tonnes @ 8.2 g/t Au was calculated for a total of 159,362 ounces (Table 5).

Table 5: Summary of Upper Ridges Resources, TGM Feb 1998

Lode	True Width	Tonnes	Grade (g/t)	Ounces
U Ridges West 1	1.00	16,462	24.74	13,093
U Ridges West 2	1.71	96,648	4.65	14,449
Standing Stone	1.57	147,979	7.00	33,303
Upper Ridges 1a	1.63	97,570	10.79	33,848
Upper Ridges 1b	1.81	17,201	14.41	7,947
Upper Ridges 2	2.39	101,441	11.45	37,343
Upper Ridges 3a	1.41	76,198	4.21	10,314
Upper Ridges 3b	1.32	18,194	8.45	4,943
Upper Ridges 4	1.00	30,672	4.18	4,122
TOTAL	1.69	602,365	8.23	159,362

This estimation extrapolated the continuity of the veins over vertical and lateral distances of more than 25 m. If polygons around individual intersections were restricted to 25 m then the inferred tonnages decreased by the order of 50-60% reflecting the lower density of drilling in the southern part of the Tuvatu Mine. Additional drilling was considered to be required to infill this resource area in order to upgrade the area to Indicated Resource category.

6.3.3 Geoval 1998 Global Resource

Between September 1997 and February 1998, resource consultants Geoval completed a resource calculation for the Tuvatu Lode and Nasivi-SKL stockwork area. Estimated used a 3D “service variable” block modeling technique using 2.0 m composites and a 1.0 g/t cut-off. A revised resource figure for the Murau Flatmake was calculated using the September 1997 Geoval block model after the area included in the February 1998 Geoval re-calculation of the Nasivi-SKL stockwork was excluded. Global resource figures for the various lodes are summarised in Table 6.

Table 6: Summarised Tuvatu Resource (Feb 1998)

Lode	Lower Cut-Off	Tonnes	Grade (g/t)	Ounces
Upper Ridges	2.00 m-g	602,000	8.2	159,362
Nasivi / SKL	1.00 g/t	323,000	3.5	36,244
Murau	1.00 g/t	196,000	2.2	14,249
Tuvatu	1.00 g/t	103,000	2.2	7,186
TOTAL	1.00 g/t	1,225,000	5.5	217,041

6.3.4 TGM 1999 Upper Ridges, Nasivi and SKL Resource

After the completion of the Phase 2 work programme by TGM in July 1999, an additional resource calculation was completed for the Upper Ridges area based upon data gained from underground development and surface and underground drilling (Table 7). A polygonal estimation was carried out internally by TGM with 25 m radius polygons being drawn on longitudinal sections in the plane of each interpreted lode. Using a lower cut-off for each intersection of 2 m-grams a boundary was drawn around all intersections greater than 2 m-grams.

In contrast to previous calculations an upper cut of 30 m-grams was applied where applicable. This figure was established by plotting a log normal cumulative frequency plot of all available Upper Ridges data and measuring the m-gram figure at the 95 percentile level. Continuity of veining beyond 25 m was assumed where no conflicting evidence occurred. Equal weighting was given to each intersection within the model boundary of the lode when calculating average width and average grade of the lodes. A density of 2.7 g/cm³ was used.

Table 7: Upper Ridges Resource (July 1999)

Lode	Lower Cut-Off	Tonnes	Grade (g/t)	Ounces
Indicated	2.0 m-g	19,300	9.7	6,020
Inferred	2.0 m-g	964,000	7.8	241,775
TOTAL	2.0 m-g	983,300	7.8	247,795

Two areas of indicated resource were calculated for the UR1 South strike drive area and the UR2 North strike drive area based on geological and channel sampling data on 2 m centres in the development underground. It was assumed that the structures could be extrapolated for a minimum of 25 m in the vertical orientation based upon results from the developed rise on the UR1 South and UR2 South lodes.

The resource figures calculated using development sampling data for the UR1 South and UR2 North development were found to be within 10% and 15% respectively of the figures calculated from drill holes. In addition it was found that the sampled grade of each of these areas was higher than indicated by drilling.

Upon completion of the Phase 3 drilling programme, the geological model was updated and a new manual resource calculation was completed by TGM using the same parameters as for the July 1999 estimate. Figures previously calculated by Geoval for the Nasivi-SKL area were superseded by resource figures for the GRF steep shear and the Murau lodes. Updated resource figures were not calculated for the SKL flatmakes. Preliminary figures were also calculated for the West lodes, located 500 m west of the Nasivi-SKL area.

6.3.5 Vigar 2000 Resource

In April 2000, Andrew Vigar of Vigar and Associates (“VA”) was commissioned to review the geology and resource estimates detailed by TGM. Further to this VA constructed a geological and resource model for the Upper Ridges lodes and estimated geological resources for each lode. Indicated resource estimates were subsequently converted to reserves using economic cut-offs, minimum mining widths and dilution.

In August 2000, following a verification of the Tuvatu database, it was found that a number of intercepts used in the April 2000 resource estimate had been excluded from the model and VA and Associates were commissioned to revise the resource calculation

Lodes, geological units, workings and resource zones in the Upper Ridges area (as well as the GRF lode) at Tuvatu were defined as a series of closed wire-frames. Each wire-frame is made up of a series of connected triangles which fully enclose a volume and is referred to as a “solid”.

Lodes were modelled as mutually exclusive wire-frames, one for each lode (Table 8). The lode widths were taken from the wire-frames. All drill-holes intersecting the structure were used, whether mineralized or not.

Table 8: Lode wire frame –drillhole details

Wireframe	Number of intercepts	WF Volume (m ³)
UR1	69	117710.3
UR2	133	300234.5
UR4	45	79406.8
UR5	48	127694.4
UR6	36	102722.7
UR7	15	97685.6
UR8	11	104455.7
URW1	93	220146.2
URW2	72	151057.8
URW3	88	174019.1
GRF1	24	38271.1

A total of 41 lodes were identified of which 37 had sufficient intercepts to be modelled in the resource estimate. True widths were used and a mining width of 1.2 m allowed, fully diluted at zero grade.

One block model to accommodate the major lodes was created to contain the grade model and allow for tonnage, grade and reef width estimates. The blocks were set at 9.6m x 9.6m x 9.6m, with sub-blocking down to 1.2m. Ordinary Kriging estimation was used for the grade of each block. Data used for the calculation were drill lode composites where an upper cut of 75.0 Au m-grams was applied on the raw drill data prior to lode compositing.

Lode blocks were filled with grades using the estimation of a width*grade accumulation using ordinary kriging and calculation of grade using the local block model width. This method also removed any bias with direct estimation of grades where wire-frame volumes were not adjusted. Each lode was filled separately only using drill intercepts from that lode. Estimates were made as width multiplied by grade and the grade back-calculated.

The extent of the search ellipse used in the Ordinary Kriging modelling of the lodes was based on analysis of the level data, geological controls and test runs to create a grade distribution that, based on experience with narrow vein deposits, was likely to be realistic.

Resources were classified in regions as Indicated or Inferred based on drill spacing, kriging variance and number of holes used in estimation of each block. A density of 2.7 t/m³, a cut-off grade of 3.0 g/t Au and a minimum width of 1 m were applied.

Table 9 summarises the total resources as reported by VA in August 2000 using a 3.0 g/t Au cut-off. The resource was stated as being JORC compliant at the time. The resource estimate for the Murau and West lodes was not recalculated by VA in 2000 and is an original estimate undertaken by TGM internally in February 2000 for which there is no documentation available. No further resource drilling was conducted after 2000 until 2012.

Table 9: Historical Resource Figures Vigar 2000

Lode	Indicated Resource			Inferred Resource		
	Tonnes	Gold grade g/t	Gold ounces	Tonnes	Gold grade g/t	Gold ounces
Upper Ridges	785,100	7.9	199,408	616,200	9.8	194,150
GRF	42,700	6.8	9,335	6,000	4.7	907
Murau				89,700	6.6	19,034
West Lodes				100,300	7.3	23,540
TOTAL	827,800	7.9	208,743	812,800	9.1	237,631

6.4 HISTORIC UNDERGROUND DEVELOPMENT AND SAMPLING

A total of 1,341 m of decline, strike and rise development has been undertaken in the project area including a 600 m exploration decline.

During TGM's Phase 1 an exploration decline was developed with minor crosscut and strike drive development to evaluate the continuity and grade of the gold mineralized structures. Underground development started in November 1997 and a total of 572.40 m of development was completed to a depth of 240m below surface. Geological mapping of the underground development and systematic channel sampling was carried out. A total of 588 samples were found to exceed 1.0 ppm and 214 samples were found to exceed 10.0 ppm Au. The maximum value was found to be 0.6 m at 840 g/t Au for a vertical sample taken from H-Lode. In total 32 samples were found to exceed 100 g/t Au.

A number of the lodes were intersected and sampled and an underground drilling programme was undertaken. In conjunction with the underground development, 17 underground diamond drill holes (TUG-01 to 17) were completed for a total of 1,108 m of HQ diameter core. Drilling was carried out using a Longyear LM-75 electric hydraulic drilling rig. The purpose of these holes was to infill surface drilling and to assist in planning future development.

Phase 2 of exploration work at Tuvatu started in March 1998 and involved deepening of the decline in order to access the Upper Ridges lodes in the southern part of the resource area. These lodes had previously been identified during Phase 1 by surface drilling at a broad spacing. In conjunction with the Phase 2 underground development, 26 more underground diamond drill holes (TUG-18 to 43) were completed for a total of 1,374 m of HQ diameter core. Drilling was carried out using a Longyear LM-75 electric hydraulic drilling rig. The purpose of these holes was to infill surface drilling and to assist in planning development. A bulk sample of Upper Ridges' ore from the underground development was dispatched to Vatukoula for metallurgical test work. In addition a small trial mining exercise was carried out on veining associated with the Nasivi/SKL stockwork.

During Phase 3 a series of 69 underground diamond drill holes (TUG045–113) were completed for a total of 10,926 m. Drilling was carried out using a Longyear LM-75 electric hydraulic drilling rig and a Kempe rig. These holes were drilled to infill and expand the Upper Ridges resource and test peripheral mineralized zones in the Murau area. This programme successfully extended the Upper Ridges lodes (particularly UR2) and upgraded the Phase 2 resource.

7 GEOLOGICAL SETTING AND MINERALIZATION

7.1 REGIONAL GEOLOGY

The information on regional geology is taken from Vigar, 2009.

Fiji lies on the boundary of the Indo-Australian and Pacific tectonic plates, a zone marked by seafloor spreading and transform faulting. The island is at the midpoint of the opposing Tonga Kermadec and New Hebrides convergence zones. It is separated from these actual convergence zones by two extensional back arc basins, the North Fiji Basin to the west and the Lau Basin to the east and a series of transform faults including the Fiji Fracture Zone and the Matthew Hunter Ridge. Approximately five million years ago (Miocene/Pliocene Period) the area was the site of a number of major shield volcanoes, formed along a northeast - southwest trend.

Tuvatu is one of several epithermal gold systems along the >250 km northeast trending Viti Levu lineament, which are genetically associated with alkalic magmatism (Figure 5). A number of gold deposits have been discovered along this trend including Tuvatu, Vatukoula and Raki Raki. The Vatukoula or Emperor Mine has produced some 7 million ounces since 1937.

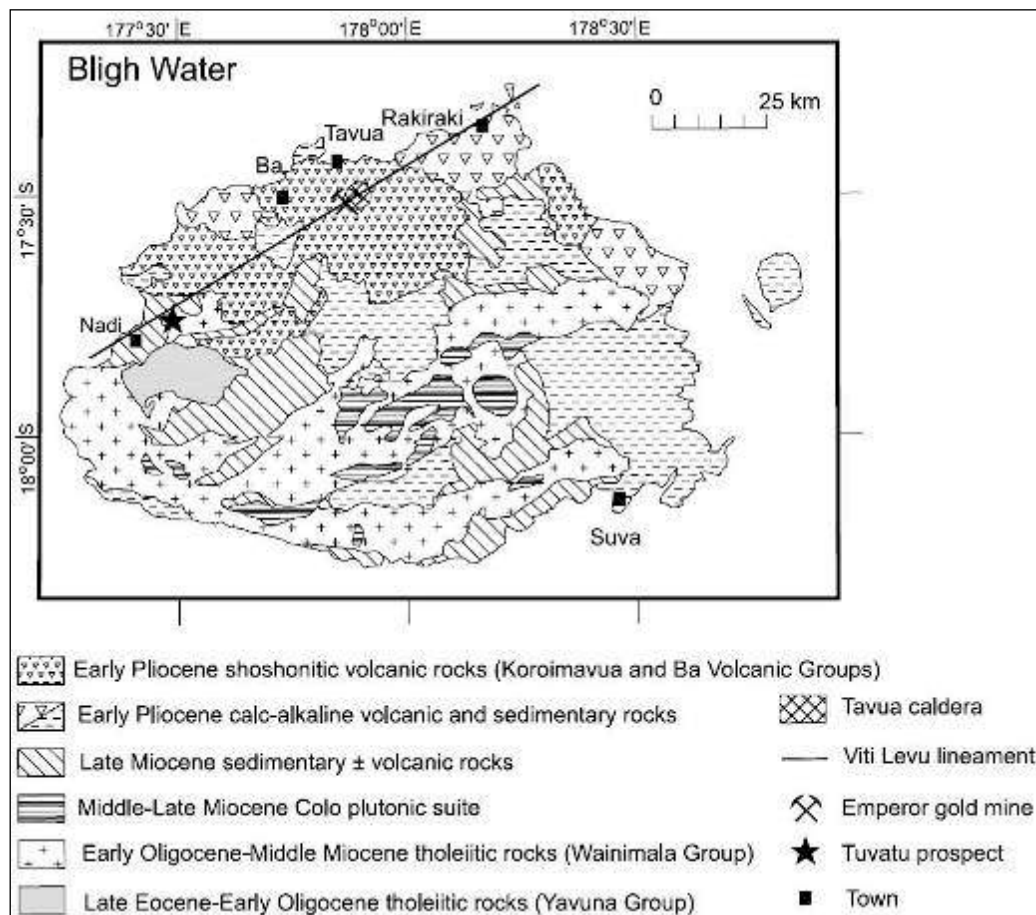

Figure 5: Regional Geology. Location of Tuvatu project with respect to Viti Levu lineament is indicated
(Source: Spry and N. L. Scherbarth, 2005)

The oldest unit in the region is the Nadele Breccia (Late Oligocene -Middle Miocene, 29 to 23 Ma). Thin layers of sandstone and siltstone are interbedded with grits and often exhibit cross-bedding. Polymict breccias tend to be very coarse, compact and with generally angular clasts ranging from 5 mm to 200 mm (Niurou, 1997). Minor occurrences of limestone have also been noted. Pillow

basalts occur as part of this sequence and can be seen in road cuttings on the project access road. The Nadele Breccia is part of the earliest volcanic activity in Fiji which took place during a period of island arc development. The volcanic units were deposited within an active fore-arc basin as proximal dispersal aprons of volcanic sediment derived from volcanic edifices (Hathway 1993).

Sabeto Volcanics (Late Miocene–Early Pliocene, 5.5 to 4.8 Ma) unconformably overlie the Nadele Breccia and represent the basal unit of the Korroimavua Volcanic Group, which is the oldest shoshonite volcanism in Fiji. The volcanics occur in a north east trending band across the north western side of Viti Levu and host a number of gold mines and prospects including Tuvatu, Vatukoula and Raki Raki. The unit consists of a series of interbedded andesitic volcanoclastics and flows. Hatcher (1997) subdivided this group into three units comprising a basal volcanoclastic breccia (30 m to 45 m), andesite porphyry flow (30 to 40 m) and volcanoclastic conglomerate (40m). The contacts were observed dipping at 50° to 60° to the east-southeast.

A clear contact can be observed in the field at the position of the unconformity and is often accompanied by a distinct change in soil types with the red brown Nadele Breccia contrasting the grey sandy soils of the Sabeto Volcanics. High ridges and cliffs emphasise this gradation due to the resistance of the Sabeto Volcanics to weathering.

The Navilawa Monzonite (Late Miocene – Early Pliocene, 4.85 Ma) intrudes the Nadele Breccia in the northeast of the project area and hosts the majority of the mineralization. The intrusive has been divided into two phases, a central coarse to medium grain monzonite and peripheral micro monzonite. Abundant dykes cut the area ranging in composition from pegmatite to andesite, aplite and monzonite. The composition of the monzonite is equigranular with plagioclase (45%) and K-feldspar (45%) with lesser biotite and pyroxene. Considerable local variation in composition occurs with changes in grain size and inclusion of country rock. The overall intrusive complex is elongate in a north east orientation. Numerous small intrusive stocks, dominantly composed of micro monzonite also occur but tend to be elongated in a north northwest direction.

A-Izzeddin (1997) suggested that there is a spatial and temporal relationship between the emplacement of the intrusive complex and mineralization. The Tuvatu area appears to have had one to two kilometres of overburden removed since emplacement of the intrusive complex, which may represent the magma source for overlying volcanism. The gold mineralization therefore represents deep-seated hydrothermal fluids emplaced in the very upper portions of the magma complex during the waning phases of volcanism.

7.2 LOCAL GEOLOGY

Tuvatu is one of several gold prospects known from the Sabeto area of north-western Viti Levu. Other gold and gold copper prospects in the local region are at Vuda, Navilawa (Kingston Mine and Banana Creek) and Nawainiu Creek, all associated with known or presumed centres of volcanic activity and/or volcanic core complexes within the shoshonitic Korroimavua Volcanic Group of late Miocene to early Pliocene age.

Basal units of the Sabeto Volcanics (part of the Late Miocene-Early Pliocene Korroimavua Volcanic Group) unconformably overlie Nadele Breccia in the Sabeto Valley. Members of the Sabeto Volcanics found outcropping in the area have shoshonitic affinities and include andesitic and biotite-bearing dacitic lithic and crystal tuffs, grits, agglomerates and minor flows. Shoshonites belonging to the Korroimavua Volcanic Group have been age dated at 5.88 Ma.

The volcanoclastic units were subsequently intruded by a monzonitic stock (Figure 6). Mapping by Emperor geologists indicated that it is a composite intrusive body with several different phases of intrusion associated with it. The monzonite within the Tuvatu prospect area is locally brecciated and

varies in grain size. A series of pegmatite dykes, andesitic dykes and stocks have also intruded the area. The monzonite has been dated at 4.85 Ma, and is interpreted to be co-magmatic with the volcanic units of the Koroimavua Volcanic Group. It probably represents the root of a caldera and is elongate in a northeast-southwest orientation.

Locally the geology is structurally complex with the area cut by an 60 m wide east-west striking fault zone referred to as the Core Shed Fault (CSF) which is exposed near the portal of the decline and can be traced for over 5 km along strike. Additional westerly striking structures locally offset veins.

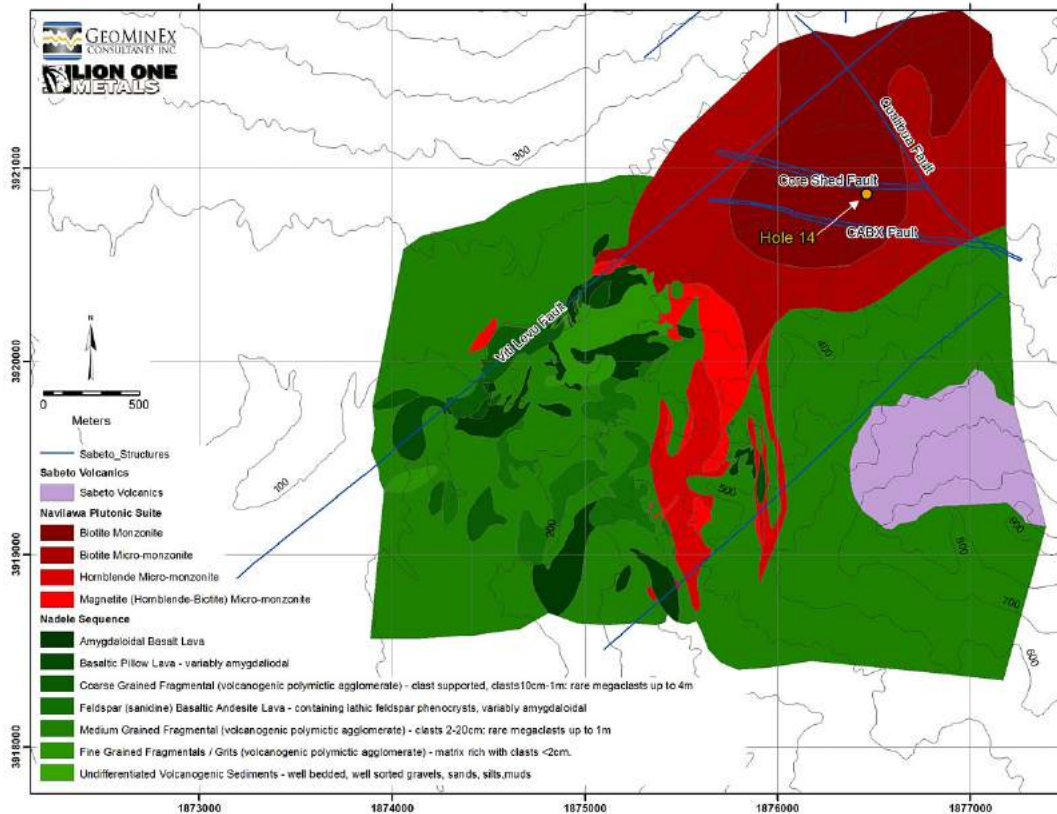

Figure 6: Project Geology

7.3 MINERALIZATION

Mineralization is structurally controlled and occurs as sets and networks of narrow veins and cracks, with individual veins generally ranging from 1 mm to 200 mm wide (Figure 7, Figure 8). Zones of veining which comprise the lodes may be up to 5 m wide. The main mineralized zone (Upper Ridges) comprises eleven principal lodes with a strike length in excess of 500m and a vertical extent of more than 300 m. Another major zone of mineralization (Murau) strikes east-west and consists of two major lodes with a mapped strike length in excess of 400 m.

Although gold mineralization is primarily hosted in monzonite it can also occur in the volcanic units. Veins are narrow, generally less than 1 m up to a maximum of 7 m, and ore grades are erratic. Lode mineralogy is varied, with most veins containing quartz, pyrite, and base metal sulphides.

Figure 7: Visible Gold in W3 lode, TUDDH371 at 204.3m (I.Taylor, 2013)

Figure 8: Murau Lode outcrop (I.Taylor, 2013)

A very high proportion of the gold occurs as either free gold or is contained in quartz or pyrite composite particles that can be floated. Free gold present is both fine and coarse grained. Mineralization is clean with respect to deleterious elements such as arsenic, selenium, and uranium.

A number of different lode structures were identified by TGM geologists in the Tuvatu resource area, and zones of veining which comprise the lodes may be up to 5 m wide. The main lode structures identified by TGM are shown in Figure 9 and comprise 10 lodes in the Upper Ridges area, 2 lodes in the Murau area, 3 lodes in the West (Plant Site) area, 2 lodes in the Tuvatu area and 3 lodes in the SKL area. Lodes were re-interpreted by Lion One geologists following infill and resource extension drilling (Figure 10).

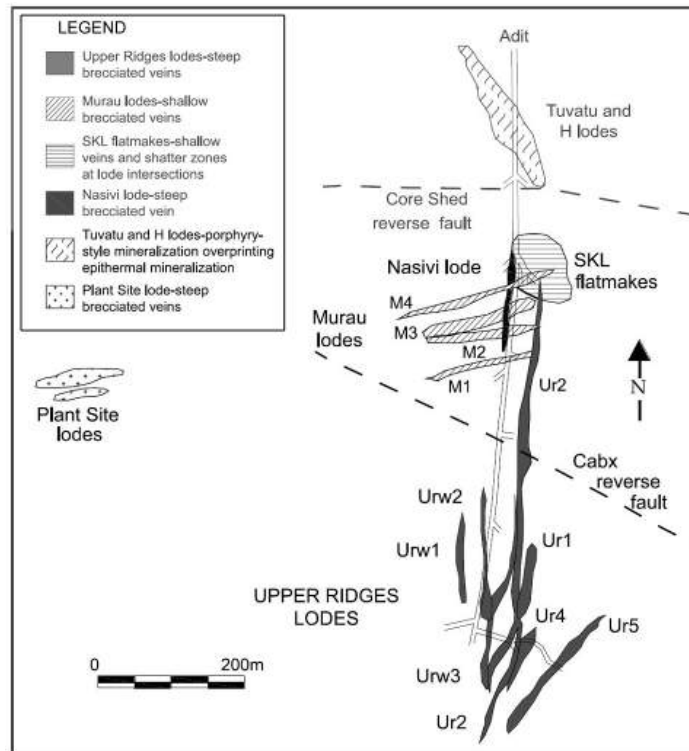

Figure 9: Plan view of Tuvatu lode structures (historic interpretation) (Source: P. G. Spry and N. L. Scherbarth, 2005).

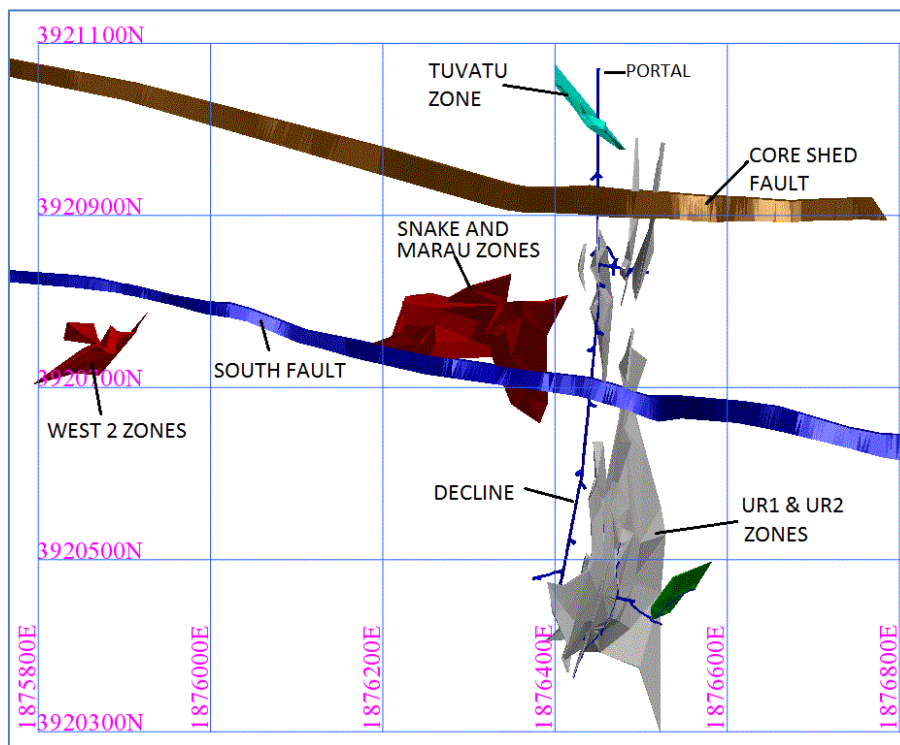

Figure 10: Current Lion One Interpretation of Mineralized Zones

In addition a number of other lodes have been identified in the local area but remain untested. The grades of individual lodes vary considerably due to the “spotty” nature of the gold and the variability

in width of the host structures. Average grades for the lodes range from 2.0 g/t to 10.0 g/t. Gold mineralization tends to be quite coarse and visible gold is often observed in mineralized sections of core (Figure 7).

7.3.1 Structural Controls

Gold mineralization at Tuvatu is considered to have developed during an episode of northeast-southwest shearing and is intimately related to but postdates the emplacement of a high level monzonite intrusive.

7.3.2 Dimensions and Continuity

Mineralization is generally hosted in a series of sub-vertical, north and north-northeast striking trending veins as well as shallow, south dipping veins (locally referred to as “flatmakes”). In spite of the narrow widths of individual veins the gross lode structures appear to be continuous for over one hundred metres. The majority of lodes vary in width from 0.5 m to 5.0 m with an average width of 1.1 m. (individual vein intercepts have been recorded as low as 4 cm)

The Tuvatu and H Lodes are up to 5 m wide and are characterized by porphyry-style copper mineralization. The H Lode is crosscut locally by epithermal gold veins, and the Tuvatu Lode is characterized by potassic alteration and hosts chalcopyrite and biotite.

7.3.3 Paragenesis

Scherbarth and Spry (2006) suggest that the mineralized zone at Tuvatu may have originally developed as a porphyry copper system which was overprinted by epithermal gold mineralization. The style of mineralization is thought to have evolved as the local monzonite intrusives cooled and meteoric waters mixed with the magmatic fluids, resulting in the gradational changing of the mineralization and alteration styles.

Mineralization associated with the porphyry copper system is characterised by apatite-k feldspar-magnetite-biotite veins with intense potassic alteration selvages. These veins are considered to have developed as the monzonite intrusive was in the final stages of crystallisation and early stages of cooling. As the system cooled it was overprinted by a phase of phyllic alteration which was characterised by a quartz-muscovite-pyrite assemblage. The system was then overprinted by a set of quartz-adularia veins accompanied by lesser amounts of calcite, chalcopyrite, pyrite, galena, tellurides and native gold. These veins generally have narrow chlorite-smectite selvages and commonly exhibit banded textures. A summary of the mineral paragenesis at Tuvatu is shown in Figure 11.

Minor roscoelite (vanadium K-mica) has also been observed in association with the quartz-adularia veins. Roscoelite is commonly observed at Vatukoula and many major deposits around the world (eg Porgera, Hishikari) and invariably has a close association with gold mineralization. The precipitation of roscoelite generally requires the reduction of a vanadium-bearing mineralising fluid. Reduction of the mineralising fluid may also lead to the precipitation of gold, tellurides and pyrite. Also rare occurrences of fluorite have been observed associated with the veins. The presence of fluorite further demonstrates the strong magmatic volatile content of the mineralising fluids.

The following is an overview of the mineralization, modified after A-Izzeddin (2000).

- Hosted in structurally controlled sets of narrow quartz veins (generally less than 0.5m) which may form mineralized lodes up to 5m wide.
- Early porphyry-related mineralization overprinted by late epithermal episode.
- Bleaching and alteration halo of sericite and clay minerals becomes more pronounced with weathering.

- Gold is free-milling and generally associated with silica/quartz, adularia and minor base metals (galena and sphalerite) and tellurides.
- High grades may be encountered in lodes, e.g. 0.5m @ 1620 g/t & 0.3m @ 1130 g/t Au.

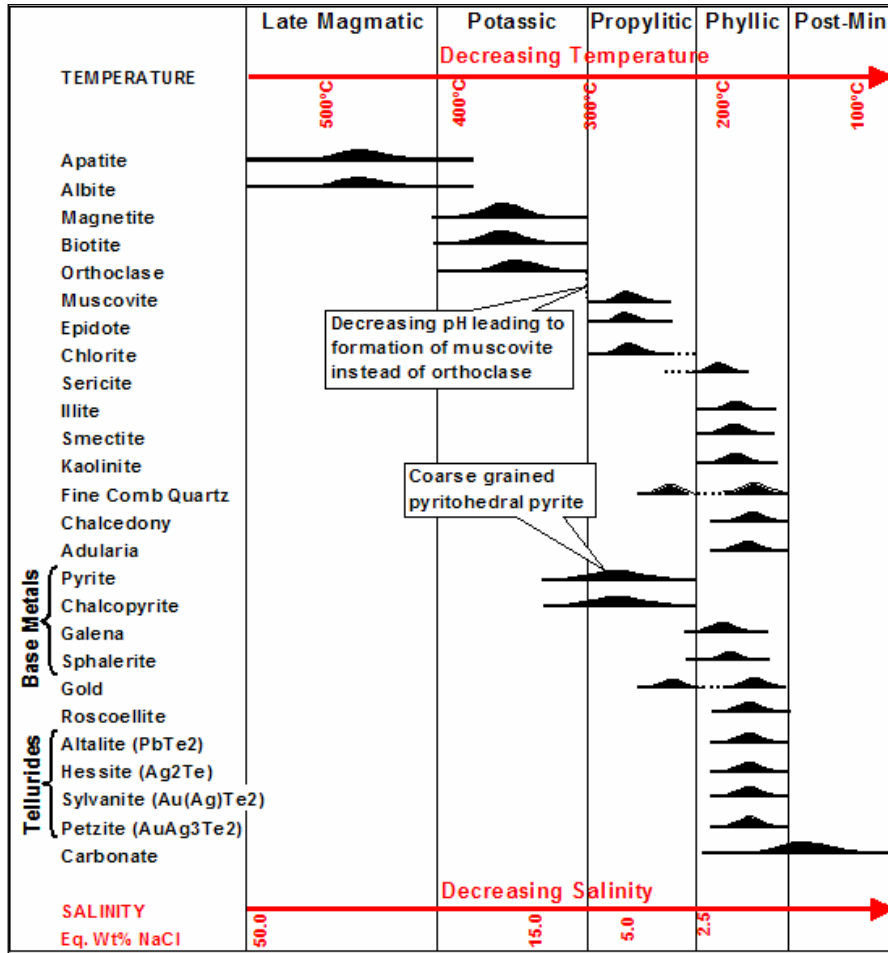

Figure 11: Paragenesis of Mineralization, (A-Izzedin 2000)

A-Izzedin (1997) suggested that there is a spatial and temporal relationship between the emplacement of the intrusive complex and the mineralization. The Tuvatu area appears to have had one to two km of overburden removed since emplacement of the intrusive complex, which may represent the magma source for overlying volcanism. The gold mineralization is interpreted to have been derived from deep-seated hydrothermal fluids emplaced in the very upper portions of the magma complex during the waning phases of volcanism.

7.4 DISCUSSION

MA concludes the geological model is quite robust. Tuvatu is a low sulphidation epithermal deposit associated with the intrusion and subsequent cooling of a local monzonite. Stress regimes within epithermal/intrusive systems can be quite complex. The resulting veins and stockwork zones will pinch and swell along various strike orientations. This style of emplacement will always result in a risk to the tonnes and grade of any model developed. The mineralization is typical of epithermal deposits in being confined to narrow structures with little wall rock alteration which are hence “blind” outside of the mineralization. The grades decrease rapidly from very rich to barely detectable.

8 DEPOSIT TYPES

Scherbarth and Spry (2006) compare Tuvatu with Vatukoula. The Emperor deposit occurs along the margins of the Tavua volcano whereas the Tuvatu deposit may occur adjacent to an eroded shoshonite volcano. Both deposits are described as low-sulfidation, epithermal gold telluride mineralization occurring in flat-lying veins, steep faults, shatter zones, stockworks, and hydrothermal breccias. Mineralization formed in multiple stages and is characterized by the presence of quartz-roscelite telluride veins in which gold-rich tellurides were deposited prior to silver-rich tellurides. Gold tellurides and vanadium minerals were deposited at approximately 250°C from moderately saline fluids.

The emplacement of epithermal deposits is characterised by late-stage, multiphase tectonic activity which creates a plumbing system and volcanic activity which provides a heat source. The general nature of these systems was first summarised by Buchanan (1981). The deposits were then divided on the basis of their alteration and mineralogy into two main types (Berger and Bethke 1985; Heald et al 1987) of acid-sulphate and adularia-sericite with a third minor but economically significant grouping of alkalic recently added (Bonham 1988; Richards and Kerrich, 1993). These types have now been included in a larger grouping low to high sulphidation systems and the links to gold and copper porphyries recognised.

9 EXPLORATION

Lion One has undertaken exploration activities in the Tuvatu project in two main phases: surface work and limited exploration drilling from 2008 to 2010 and more extensive drilling in 2011-2013.

9.1 2008-2010 LION ONE EXPLORATION

During 2008, Lion One completed extensive mapping and geochemical sampling. Two surface drill holes were also completed. Field work was carried out by Lion One staff, W. Kuruisaravi, R. Sulua, and S. Bulu under the direction of various expatriate consulting geologists. The mapping, rock chip and channel sampling program involved the hiring of a trained team of permanent workers from Korobebe Village. Security staff at the Tuvatu Camp and core shed facility were hired from Korobebe, Nagado and Natawa Villages.

A number of highly prospective zones of mineralization that were identified in 2002-2003 were followed up (Figure 12).

- Nubunidike Prospect
- Ura Creek Prospect
- Jomaki Prospect
- Tuvatu South Prospect
- Qalibua Prospect

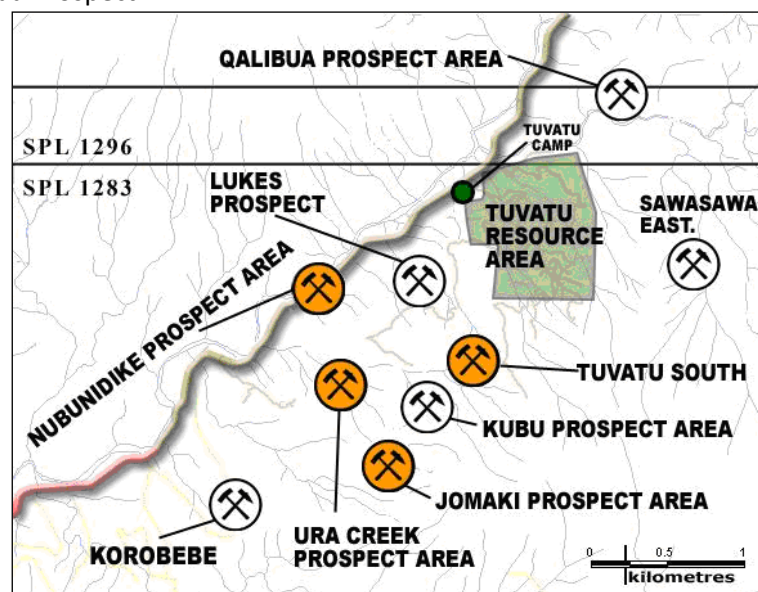

Figure 12: 2008 Prospect Locations

Detailed geological mapping, rock chip and channel sampling in the region south of the Tuvatu Resource Area and Qalibua Creek was carried out with about 11.5 line-km of creek mapping completed. Detailed 1:1000 scale geological mapping and sampling covered the area from Veto Creek to the boundary of SPL 1396 just north of the Tuvatu Resource Area. Lion One submitted 1,309 rock chip and channel samples between November 2008 and May 2010 to ALS Chemex laboratories in Brisbane. MA has not seen any reports on this mapping or sampling detailing geology, vein widths and assay results.

Two surface diamond drill holes (TUDDH-338 & TUDDH-340) totalling 375.90m were drilled during October 2008 at the Nubunidike Prospect, 1.6 km southwest of the Tuvatu Resource Area. Drilling was planned to intersect the Nubunidike/Hornet Creek/290 Vein system about 50 m below the

surface over a strike length of 500 m and gain information on the dip and strike continuity of the vein system, as well as grade distribution within the structures.

9.2 2011 LION ONE EXPLORATION

Following a comprehensive review of historic data that began in August 2010, Cambria Geosciences ("Cambria") was contracted to assist in managing the exploration program at Tuvatu. In January 2011 Cambria mobilized a field team to the site to initiate a program of surface mapping, trenching and core re-logging and re-sampling of approximately 10,000 m of the total 60,000 m of core. In addition to the ongoing program of mapping, core re-logging and re-sampling, trenching and diamond drilling, this first phase exploration program was planned to include reconnaissance mapping, prospecting, stream sediment sampling, geophysical surveying, deposit modelling and dewatering of the decline.

Lion One reported that the review, along with ongoing mapping and prospecting conducted by Lion One geologists, resulted in the discovery of several near surface drill targets that became the focus of the trenching and surface mapping programs.

In excess of 1,200 m of trenching was completed to assess the near surface, open pit potential of the Tuvatu North area where drilling by previous operators had yielded several near surface high gold intervals in the northern portion of the Tuvatu Resource area. Principal objectives were to expose and confirm the presence of gold bearing veins and veinlets in the structures related to the Tuvatu Lode, H Lode and the Core Shed Fault (CSF).

Initial sampling was between the Core Shed Fault (CSF) and the Tuvatu and H Lodes from four benches and two trenches excavated adjacent to and directly south of the portal of the existing decline. Excavations were completed across the CSF, with subsequent trenching above the surface expression of the Tuvatu (1 and 2) and H Lodes. Trenches were up to 2 m deep with an average depth of 1.5 m. Several benches along road cuts were also sampled as a part of the program. Most samples were continuous or semi continuous chip samples with composite samples taken when necessary.

A core re-logging and re-sampling program was commenced with the objective of identifying mineralized intervals that were ignored by previous operators. As 3.0 g/t Au was the historical cut-off grade, Lion One geologists believed that the economic significance of many altered and mineralized zones within the hanging and foot walls were previously overlooked.

Lion One also completed 58 km of Induced Polarization ("IP") survey and prepared additional lines to obtain further readings over areas with prospective chargeability and resistivity anomalies, including five additional lines covering the First Porphyry Development Area. The survey was initially planned to cover known mineral occurrences before extension to outlying areas. Lion One also completed 36 line km of soil sampling across the IP survey grid area.

9.2.1 Results

Extensions of the Murau and Far West Lodes were mapped at surface over 500 m to the west displaying consistent lateral continuity typical of many epithermal lode systems. Multiple sub-parallel near-surface, high-grade veins were encountered.

The surface sampling program was reported by Lion One as confirming the presence of gold bearing veins and veinlets within the CSF and the Tuvatu and H Lodes. Five samples were reported to return grades over 100 g/t Au, including 210 g/t Au across 0.05 m, 188 g/t Au across 0.87 m and 188 g/t Au across 0.70 m. Significant intervals included 8.7 g/t Au over 4.8 m from the surface expression of the north-west striking Tuvatu Lode.

10 DRILLING

Drilling campaigns were completed in several phases by TGM from 1995-2001 and by Lion One between 2008 and 2013. Completed drilling is summarised in Table 10.

Table 10: Summary of Tuvatu exploratory drilling

Company	Surface RC Drilling		Surface Diamond Drilling		Underground Diamond Drilling	
	Distance (m) (Holes)	Hole IDs	Distance (m) (Holes)	Hole IDs	Distance (m) (Holes)	Hole IDs
TGM Phase 1	5,225m (44 holes)	TURC101 to 171	42,783m (193 holes)	TUDDH013 to 205	1,108m (17 holes)	TUG01 to 17
TGM Phase 2					1,374m (26 holes)	TUG18 to 43
TGM Phase 3	4,040m (37 holes)	TURC172 to 208	8,702m (24 holes)	TUDDH206 to 229	10,926m (69 holes)	TUG45 to 113
TGM 1995- 2000 Total	9,265m (81 holes)		51,484m (217 holes)		13,408m (112 holes)	
Lion One 2008			376m (2 holes)	TUDDH338 & 340		
Lion One 2012- 2013			13,842m (65 holes)	TUDDH341 to 405		

10.1 TGM 1995-2001

TGM completed three phases of drilling at Tuvatu from exploration through to resource delineation. Drilling was carried out both on the surface and from the 600 m underground exploration decline which was developed to a depth of 240 m below surface. Drilling methods included both diamond drill core and reverse circulation (RC). Overall, TGM completed 51,484m of diamond core and 9,265m of RC surface drilling, as well as 13,407m of underground drilling.

Up to six drilling rigs operated in the Tuvatu resource area during Phase 1. During this period 193 diamond holes (TUDDH-013 to 205) and 44 RC holes (TURC-101 to 171) were completed. A total of 42,783 m of diamond core (HQ and PQ diameter) and 5,225 m of 5¼" RC drilling were completed in the area. This programme delineated an area of mineralization that extends over a distance of 800 m. In conjunction with the underground development, 17 underground diamond drill holes (TUG01 to 17) were completed for a total of 1,108 m of HQ diameter core. The purpose of these holes was to infill surface drilling and to assist in planning future development.

During the 2nd phase of work by Emperor, 26 underground diamond drill holes (TUG-18 to 43) were completed for a total of 1,374 m of HQ diameter core. The purpose of these holes was to infill surface drilling and to assist in planning development.

During Phase 3 a reverse circulation drilling programme was initiated to test various anomalies in the local area as well as the near-surface potential of the Upper Ridges area. Thirty-seven holes (TURC172 – 208) were completed for a total of 4,040 m. Drill holes TURC174 and TURC 179 encountered significant mineralization associated with a previously untested lode structure located approximately 500 m west of the resource area. Follow-up drilling and trenching demonstrated that mineralization was associated with two sets of veins trending E-W and NW-SE. The lodes may be up to 5 m wide. A series of 69 underground diamond drill holes (TUG045 – 113) were completed for a total of 10,926 m. These holes were drilled to infill and expand the Upper Ridges resource and test peripheral mineralized zones in the Murau area. This programme successfully extended the Upper Ridges lodes (particularly UR2) and upgraded the Phase 2 resource.

A series of surface diamond holes were also drilled to target various deeper drill intersections encountered in Phase 1 as well as the newly identified zone of mineralization located 500 m west of

the current resource area. Twenty-four holes (TUDDH206 –229) were completed for a total of 8,702 m

10.2 LION ONE 2008

Two surface diamond drill holes (TUDDH-338 & TUDDH-340) totalling 375.90 m were drilled during October 2008 to test the Nubunidike / Hornet Creek / 290 Vein system over a strike length of 500 m at the Nubunidike Prospect, 1.6 km southwest of the Tuvatu Resource Area. Drilling was planned to intersect the veins about 50 m below the surface and gain information on the dip and strike continuity of the vein system, as well as grade distribution within the structures.

10.3 LION ONE 2012-2013

In response to the results from the trenching program Lion One changed its focus to broad zones of low grade mineralization potentially exploitable by surface mining methods. Lion One commenced a systematic program to delineate the extent of near surface gold mineralization. The Lion One exploration team planned and executed the drilling program under the supervision of Lion One's Tuvatu Project Manager, Mr. David Pals.

Drilling re-commenced in June 2012 with a combination of infill and step out holes. The program had three objectives: (i) infill drilling to increase the confidence level of the existing resource; (ii) step out drilling to expand the resource base; and (iii) exploratory drilling to test additional targets

Infill drill holes were planned to test areas of the intersections of the east-west trending Murau-Far West Lodes with the N-S trending Upper Ridge Lodes west of the north-south trending UR structural corridor and current resource. Interpreted lode locations are shown in

Figure 13.

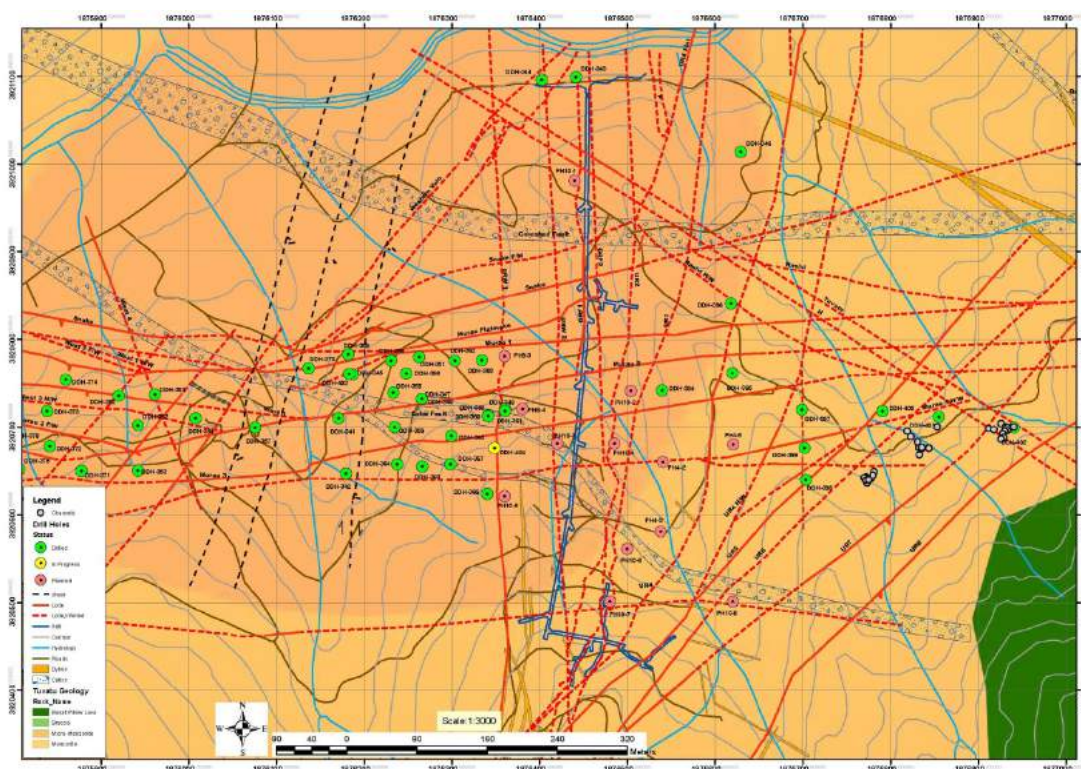

Figure 13: Tuvatu 2012-2013 Drill Collars and Lode locations (Lion One, 2013)

Step out holes tested for mineralized extensions of the Tuvatu and H Lodes in the northern portion of the Tuvatu resource area, where surface mapping has identified continuous mineralization along a strike length of 300 m.

10.4 DRILLING PROCEDURES

10.4.1 TGM 1995-2001

Up to six drilling rigs operated in the Tuvatu resource area during Phases 1, 2, and 3 but MA has no details on the type of surface rigs used.

During Phase 1 and Phase 2 the underground diamond drilling was carried out using a Longyear LM-75 electric hydraulic drilling rig from the Emperor Gold Mine in Vatukoula. Underground drilling in Phase 3 was carried out using a Longyear LM-75 electric hydraulic drilling rig and a Kempe rig.

Although Mr Vigar of MA originally worked on the deposit from 1999 to 2000, which included logging core, no detailed sampling or QAQC report is available on the sampling done by TGM.

However the following points are noted:

- Adjacent host rock material may be barren and forms internal waste within the lode structure. Where this internal waste was not assayed it was assumed to carry no grade.
- Individual veins within the lode structure were often sampled using half core samples.
- Selected drill core sections were halved with a core saw and samples were dispatched to the Emperor Gold Mining Company laboratory at Vatukoula.
- Waste intervals were not assayed.
- TGM used the assay laboratory at the Vatukoula mine operated by the Emperor Gold Mining Company. Monthly re-assays and checks on standards, mill products, mine and exploration samples are conducted with external commercial laboratories as part of the standard operating procedure at Vatukoula.
- The whole sample was pulverised in a 5 kilogram ring mill prior to splitting. A 50 g sub-sample was analysed for gold by fire assay with an AAS finish.
- All samples above 1 g/t Au were re-assayed.
- Samples within the interpreted lode structure were composited to obtain an overall grade for the lode.

All drill collars were picked up by TGM surveyors on a regular basis using a Leica TPS 300 theodolite. Data was downloaded in digital form and entered into the database. Where possible the collar azimuth and dip was also calculated by the surveyor to compare with the planned orientation and downhole survey data. The majority of diamond drill holes were also surveyed by downhole camera at 50 m intervals using an Eastman downhole survey camera. Percussion drill holes generally were not surveyed down hole due to the difficulties in surveying inside RC drill rods.

10.4.2 Lion One 2008 and 2012-2013

Drilling by Lion One was diamond core drilling from surface and the following procedures were used:

- Drill core was digitally photographed and placed onto the database.
- Core was logged manually onto log sheets and all data entered into the database.
- Information included hole number, date drilled, name of driller/company, location, coordinates, core recovery, lithology, structure, RQD values, alteration, gangue minerals, sulphide minerals, mineralization, sample numbers, intervals samples, analytical values,

comments, date logged and by whom. Specific gravity of selected intervals and lithologies were measured.

- A summary log was prepared after the hole was logged.

Drill core was cut in half with a core saw for sampling and half-core samples were dispatched to the ALS sample preparation facility in Suva, Fiji. Samples were first crushed and pulverised at Suva, Fiji prior to analysis at ALS Minerals, an independent and qualified analytical laboratory in Brisbane, Australia. Gold is determined by fire assay and silver by Aqua regia digestion and AAS. Consistent with industry standard practice, sample standards and blanks and other control methods are used to ensure quality control.

10.5 RESULTS

10.5.1 TGM 1995-2001

A table of historical drill intervals listed by lode is contained in Appendix 1 of Vigar 2009.

10.5.2 Lion One 2008

Drill holes passed through bad ground with shear zones showing slickensided contacts. Faults are almost parallel to the core axis. The host rock is coarse grained to medium grained Nadele Breccia.

Only visually identifiable mineralized intervals were assayed for gold. A total of 59 samples ranging in length from 0.23 m to 1.0 m were collected from the 376 m of drilling. Best intersection was 0.25 m containing 1.06 g/t gold in hole TUDDH-338. Hole TUDDH-340 returned insignificant results.

Following a field inspection in 2009 Andrew Vigar of MA suggested that the two drill holes may have missed their intended target as the holes were not orientated properly relative to the vein being tested.

10.5.3 Lion One 2012-2013

Initial results confirmed high grades. Figure 14 shows the collar locations of drill holes with significant intersections at Tuvatu West. Figure 15 is a north-south representative section along 1876260E in the Tuvatu West locality.

Drill intercepts are listed in Appendix 1.

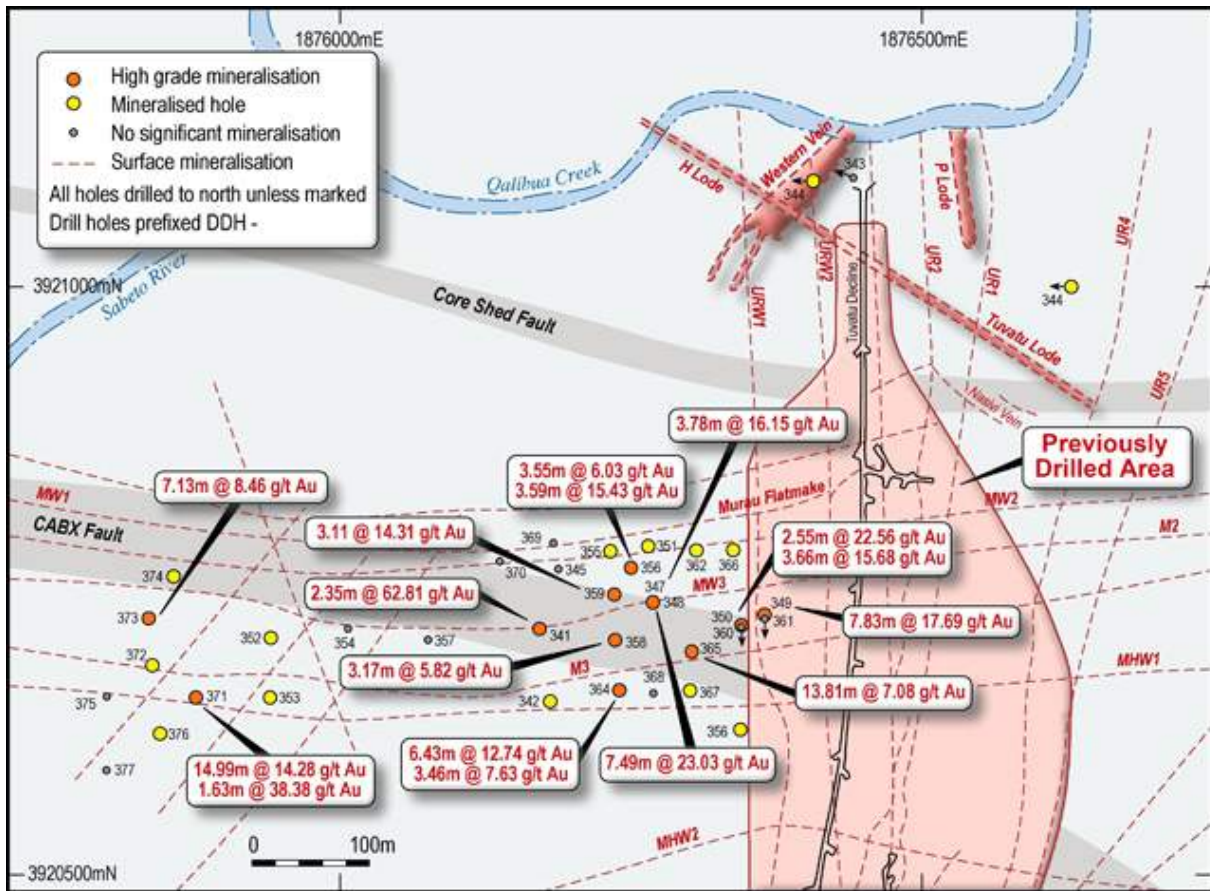

Figure 14: Tuvatu West – 2012-2013 Lion One Drill Significant Intersections

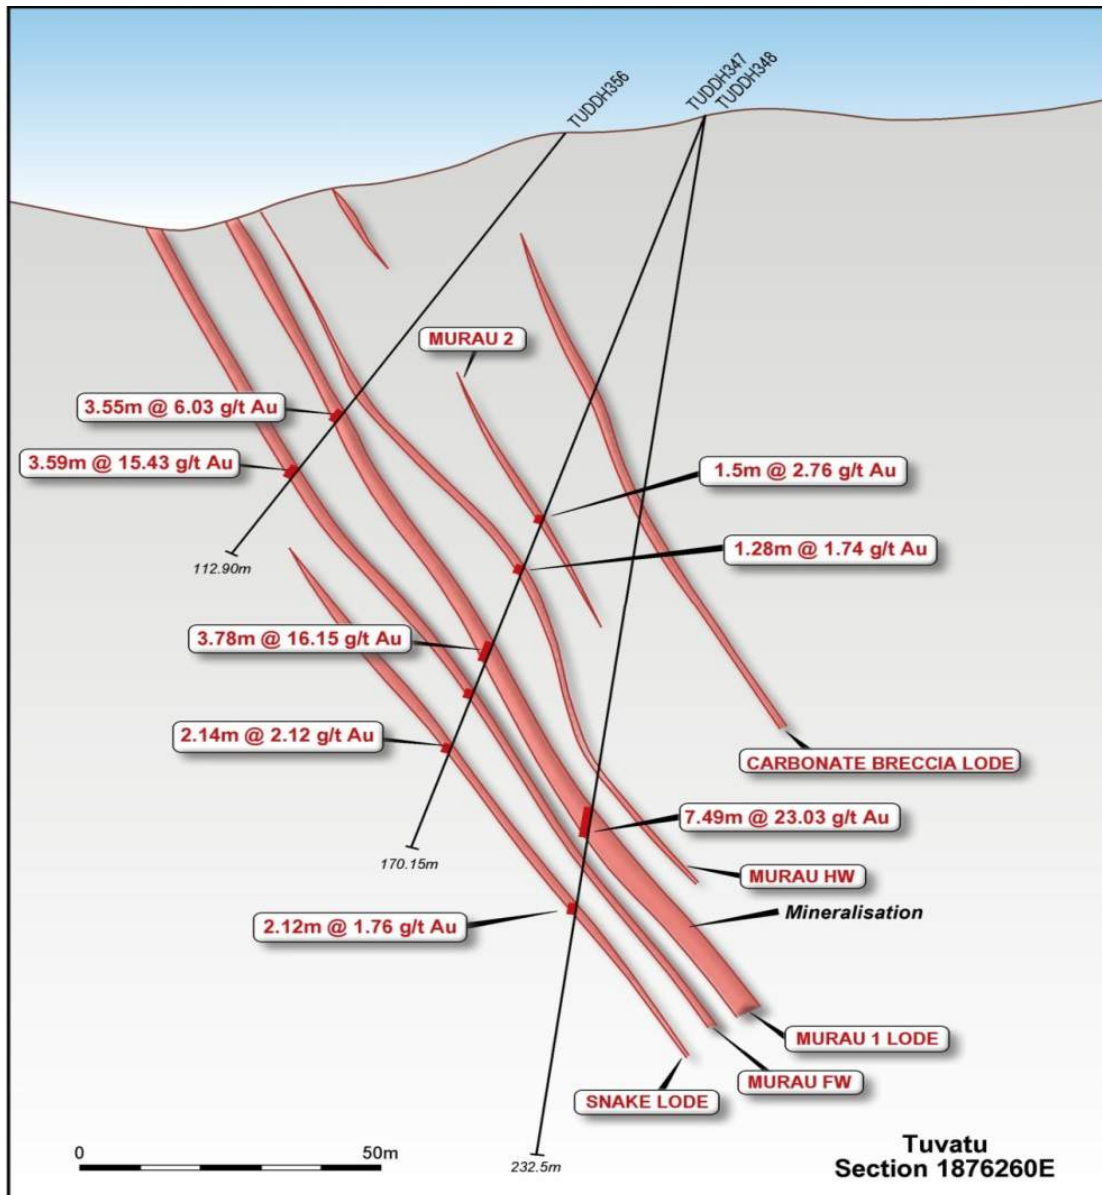

Figure 15: Murau lodes representative cross section (1876260E)
(Source: Lion One, 2013)

10.6 DISCUSSION

There has been no independent review of the drill hole sampling, geological logging and geological interpretations done by TGM or Lion One. Although it is expected that this work was done to an industry acceptable standard there is always a risk involved with structural interpretations, grade and geological continuity. However, MA believes that the information revealed in the exploration decline mitigates the impact of this risk to a large extent.

10.6.1 Recovery and Quality

Core recovery is overall very high, although within sheared and broken intervals it is somewhat less so. Unfortunately these intervals may coincide with mineralized zones.

11 SAMPLE PREPARATION, ANALYSES AND SECURITY

11.1 SAMPLE PREPARATION

During pre-2000 drilling by TGM all samples were dispatched to the Emperor Mine laboratory at Vatukoula for preparation and analysis. The whole sample was pulverised in a 5 kg ring mill prior to splitting.

In the Lion One 2008 and 2012-2013 programs diamond drill core was logged and sampled on site at Tuvatu by Lion One staff. Core samples were delivered by the Company to Suva, Fiji sample preparation facility of ALS Minerals (ALS), a division of Australian Laboratory Services Pty. Ltd., an independent accredited analytical laboratory.

The samples were finely crushed (>75% passing through -2mm) and a 1 kg split then pulverized (>85% passing through -75 microns) prior to dispatch to ALS Minerals Brisbane, an independent accredited analytical laboratory in Brisbane, Australia, for analysis.

11.2 SAMPLE SECURITY

No particular security measures were used during the life of the Tuvatu project as visible free gold is rare and off-site laboratories have been used throughout.

Half-core splits of most drill core were retained on-site. This core is well catalogued and is available for inspection.

11.3 SAMPLE ANALYSES

11.3.1 Laboratory Analysis Procedures

All pre-2000 assaying by Emperor for TGM used a 50 g sub-sample which was analysed via fire assay with an atomic absorption spectrometry ("AAS") finish at the mine laboratory at Vatukoula. All samples above 1 g/t Au were re-assayed.

All analysis in the exploration programs by Lion One in 2008, and 2012-2013 was carried out by ALS Minerals at their laboratories, in Brisbane, Australia. Gold was analysed by fire assay with a 30 gram charge and AAS finish. Samples with higher grade gold (greater than 3 g/t Au) were re-assayed. Silver was analysed by Aqua regia digestion and AAS.

Exploration samples were analysed for 33 elements using a four acid digestion and Inductively Coupled Plasma Atomic Emission Spectrometry (ICP-AES).

11.3.2 Laboratory Independence and Certification

The laboratory at the Vatukoula gold mine used by TGM was a private laboratory operated by Emperor Gold Mining Company.

The ALS Minerals laboratories used by Lion One are part of the worldwide ALS Limited group of companies.

11.4 QUALITY CONTROL

11.4.1 QC Program

There are no detailed sampling QA/QC reports available on the sampling carried out by TGM for the pre-2000 drilling. According to Vigar (2009), monthly re-assays and checks on standards, mill products, mine and exploration samples were conducted with external commercial laboratories as part of the Emperor standard operating procedure. Laboratory certificates for these assays and

checks were not provided to MA. There was no evidence of the implementation of a QA/QC program utilizing field duplicates, blanks and standards.

The laboratory at Vatukoula is a private laboratory, and it is considered unlikely that they conducted an internal QC program for the samples submitted. However, the Vatukoula mine has relied on the results of its laboratory in order to run its operations since the 1930s and it can be reasonably assumed that the laboratory provides accurate assaying work.

No information was provided to MA regarding the QA/QC program for the 2008-drilling by Lion One.

The assay analyses performed during Lion One's 2012-2013 drilling programs was subject to a formal quality assurance and quality control (QA/QC) program that was under the supervision of Lion One's Tuvatu Project Manager, Mr David Pals.

Certified reference materials ("CRM"), blanks, and field duplicates samples were inserted prior to shipment from site to monitor the quality control of the data. MA understands that 3 CRM samples were inserted every 100 samples and 2 field duplicates were inserted in every batch of 100 samples. MA received and reviewed QAQC summary reports (for CRM's, field duplicates, and assay laboratory duplicates) from rOREdata Pty Ltd. database consultants for Lion One (Appendix 2).

11.4.2 QC Program Results

11.4.2.1 Standards Results - Accuracy

Accuracy is identifying the true grade of a sample, often achieved by submitting certified reference material ("CRM") commonly referred to as standards ("STD").

Ten different gold CRM standards supplied by Rocklabs Ltd. of New Zealand were used by Lion One for quality control in core sampling. Seven of the standards were submitted more than 5 times Table 11. A total of 216 CRM gold standards and 26 silver standards were submitted during the Lion One drilling program.

Table 11: Summary of CRM Used Lion One 2012-2013

CRM Code	Certified Value	Standard Deviation	Total Submitted	No Outside Limit
SL61	5.931	0.5418	44	9
SQ47	39.88	1.1774	26	6
OxJ80	2.331	0.5822	41	12
OxJ87	0.417	0.9296	31	5
B2	0.414	0.0646	27	3
B1	5.931	0.1189	15	1
A1	2.337	0.0590	25	1
SQ47 (Ag)	122.3	5.4751	26	2

11.4.2.2 Field Blanks - Contamination

Field Blanks are obtained from within the vicinity of the project area by selecting an un-mineralized outcrop of similar mineralogy and weathering as the samples being submitted. A representative number of blank material samples are submitted for analysis to provide reference concentrations of

elements of interest. Ideally, Field Blank samples will look similar to the original material being submitted.

MA has not seen any results for field blank samples submitted to ALS Minerals with the Tuvatu drillcore samples.

11.4.2.3 Field Duplicates – Precision and Bias

Field duplicate procedures for diamond drill samples from Tuvatu have not been described in detail by Lion One.

Thirty-five (35) samples described as field duplicates were submitted by Lion One in the period 2012 to 2013. Field duplicate results are shown in Figure 16. Only one duplicate sample showed significant distance from the original value. One of the two check sample from TUDDH-384 assayed 0.64 g/t Au compared to the original sample which returned an assay of 0.16 g/t Au.

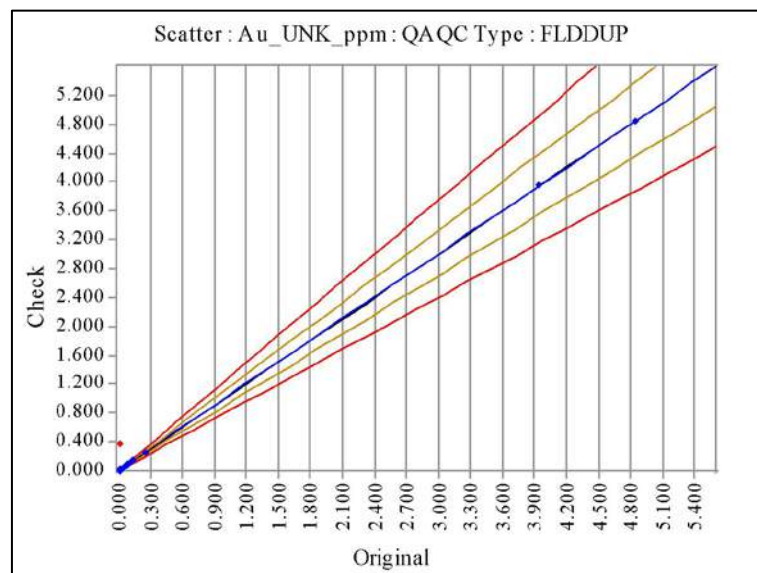

Figure 16: Field Duplicate Results for Au

11.4.2.4 Laboratory QA/QC

Lion One instructed ALS Minerals to split secondary duplicates after the core had been crushed but prior to pulverising. ALS assayed 173 of these secondary or laboratory duplicates (Figure 17). ALS Minerals conducts its own internal QA/QC consisting of CRM testing, duplicate assaying and repeats along with the primary sample analysis. MA has not seen these results.

11.4.2.5 Inter-laboratory Checks

No duplicate samples were sent by Lion One to a referee laboratory for analysis.

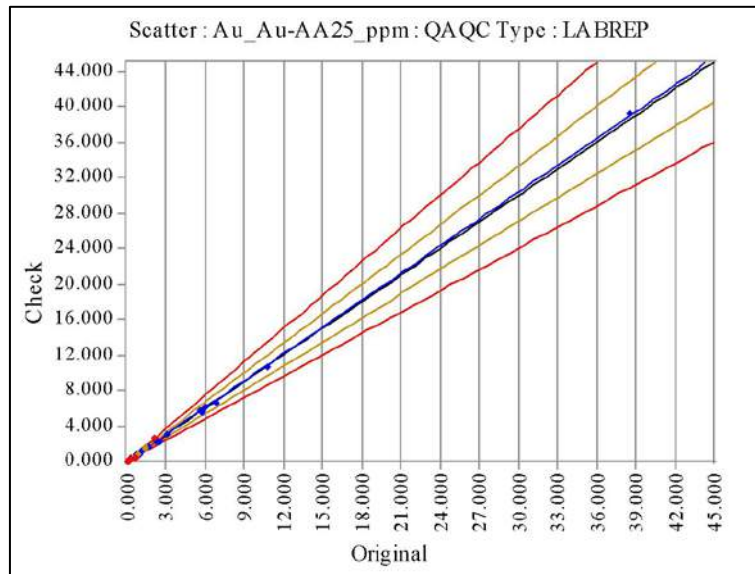

Figure 17: Laboratory Duplicate Results for Au

11.5 ADEQUACY OPINION

There has been no independent review of the drill hole sampling, geological logging and geological interpretations done by Lion One. Although it appears that this work was done to an industry acceptable standard, there is always a risk involved with geological interpretations and grade continuity.

Generally, the results of the QA/QC program implemented by Lion One are considered satisfactory for resource definition. It is MA's opinion that the sample preparation, security and analytical procedures were adequate and follow accepted industry standards for a mid-stage exploration property.

12 DATA VERIFICATION

12.1 DATA VERIFICATION PROCEDURES

The data verification involved database integrity checking, site visit, and independent sample collection.

12.1.1 Drill Hole Database

Lion One provided MA with a large amount of data relating to the Project. Lion One's current drill hole database, historic block models and geological wireframes were used, as were reports on resource estimation. MA also accessed archived data used for resource estimation in 2000 and 2009.

12.2 DRILL HOLE DATABASE REVIEW

MA was provided with an export of Lion One's current drill hole database in MS Access format, named Database ExportDrillHoles.mdb. The database contained tables for Collar details, Collar metadata, downhole surveys, assays, weathering, lithology, alteration, geotech, SG data and lode tags.

12.2.1 Database validation

MS Access queries were used to perform basic validation checks, and holes were then loaded into Surpac for a second round of validation. Table 12 summarises the basic validation checks performed and the results.

Table 12: Summary of Database Validation.

Check	Results	Comment
Missing / out of range coordinate data	Six holes with missing z coordinates	All old DDH holes (1970s). Need to confirm locations and assign z coordinates from topography DTM.
Missing downhole surveys	Four holes with no downhole surveys	Lion One checking, one hole corrected. Holes without confirmed orientation must be excluded from resource estimates.
Sample overlaps / to < from depth / no depths	A few assay intervals with null from-to depths.	QAQC results mistakenly included in assay table
Downhole survey validation check, Access query	71 drill holes with survey deviation > 5° in azimuth or dip in adjacent surveys. Note that all RC holes have only collar surveys.	Data sent to Lion One for correction / checking.
Data not drill holes	Two trenches and one channel included in drill hole data	Removed from drill hole database

12.2.2 Assessment of RC Drill Holes

Sample assay data from diamond (surface plus underground, all dates) and RC drilling were compared statistically by the following method:

1. Raw sample data composited downhole to 1 m intervals to create comparable samples of identical volume (reduce effects of sample volume variance)
2. 1 m composites were restricted to cover the same area (roughly corresponding to the 2000 resource model extents) as a crude method of compensating for possible spatial clustering of data. The following spatial filtering methods were used:
 - a. Boundary drawn in plan view to cover extent of most RC drilling;
 - b. DD data restricted in z extent to cover the same depth range as RC data;

- c. DD and RC data restricted to depths > 20m below surface (to reduce effects of shallow RC drilling near-surface);
 - d. Data plotted north and south of 3920700N, which marks the approximate limit of clustered high grade DD intercepts.
3. Q-Q (percentile) plots generated for RC versus DD data above a cut-off of 1 g/t Au for each of the spatial filters described above. Cut-off was used to compensate for the effects of mostly selective sampling of DD holes.

The resulting charts are shown in Figure 18. In all cases the red line indicates a 1:1 correlation.

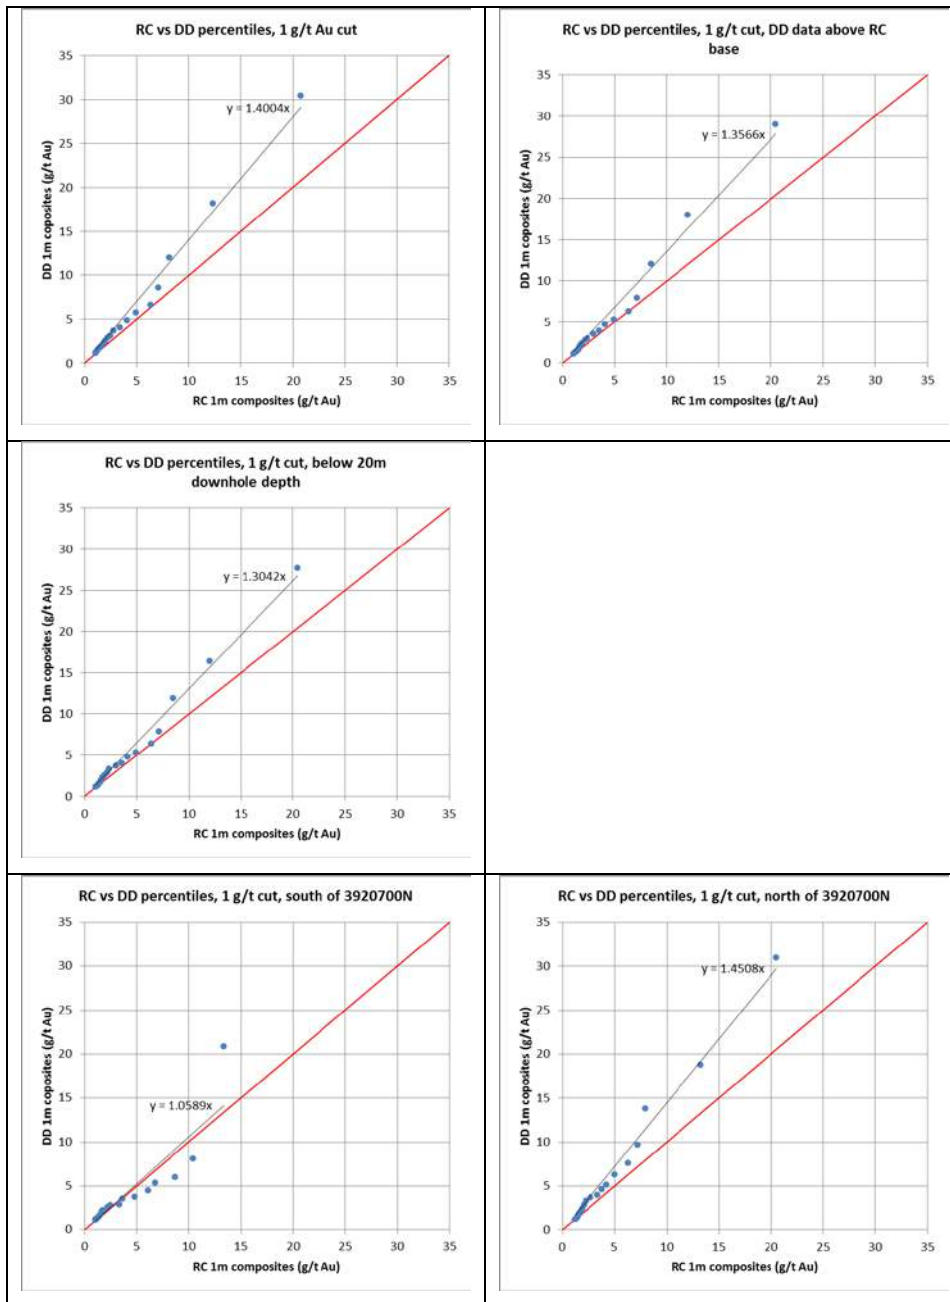

Figure 18: Q-Q Percentile Plots RC vs DD holes

In general, grade distributions match reasonably well up to the 50th percentile (about 2.5 g/t Au), with DD samples reporting slightly higher grades than RC. After the 50th percentile there is more positive bias towards DD samples, and after the 75th percentile the bias is more pronounced. There is a slight improvement in the correlation of percentiles across the first three graphs, corresponding to limiting the extent of DD data used. The data is difficult to assess in too much detail because the RC and DD samples are not exactly spatially equivalent. The last two graphs illustrate that spatial bias accounts for a significant part of the difference seen between RC and DD grade distributions, with the southern portion of the data better correlated (with a positive bias to RC data) and the northern part of the data showing positive bias towards DD data.

Spatially equivalent RC and DD samples were then selected via an approach that used a nearest neighbour method with a small search ellipse to assign grade values to a fine scale block model. Values were exported only for those blocks that contained values for RC and DD data and the results examined. This approach yielded a data set that was too small to draw any conclusions.

Limited conclusions can be drawn from the existing data. Spatial clustering appears to be a more important contributor to bias than drilling method. Other factors that may be important are:

- Sample recovery – it is not known how sample recovery compares between RC and DD samples. Some instances were identified where RC mineralized intersections coincided with not sampled DD intervals, presumably due to core loss.
- RC drilling sub-sampling – the method and possible introduction of bias during sub-sampling is not known.
- RC drilling QA/QC measures – in particular the efforts made to ensure that no sample contamination occurred during drilling and later sample processing.
- DD drilling sub-sampling – possible introduction of bias during core cutting, especially if core was not cut at a consistent orientation relative to veining.
- Directional bias – there are some examples of bias occurring where drill holes sample a vein at a low angle versus drill holes sampling veins in a perpendicular orientation.

From the available data, MA concludes that there appears to be no major problem with utilising RC samples as part of a resource estimate. However, the following should be taken into consideration:

- RC samples are inherently more likely to have lower grade variability and show less effects of high grade outliers due to the larger volume of sample taken compared with DD core.
- Due to the fixed 1 m sampling interval for RC, there will be a tendency for narrow, high-grade vein intersections to be over-estimated for thickness and under-estimated for grade (i.e. wall rock dilution will be included in the sample) compared with DD.
- For lower-grade veins the opposite problem will apply, with thickness under-estimated and grade possibly slightly over-estimated.
- Vein thickness in RC intersections can only be practically resolved to the nearest m using grades.
- The only way to compare DD and RC drill samples and assess potential risks to resource estimation is to undertake a small program of drill hole twinning.

12.3 SITE VISIT

The Tuvatu deposit was visited by Mr. Ian Taylor, BSc (Hons) MAusIMM (CP) during the period 25th to 28th February 2014.

In the course of the site visit, Mr Taylor viewed mineralized drill core and examined the drill core processing and storage facilities. He also viewed and sampled the mineralized vein systems and outcrops.

12.3.1 Independent Samples

For this report, Mr Taylor collected two independent samples, one from outcrop and one from core.

The selected samples were selected by Mr Taylor, at no time prior to the sampling were any employees or other associates of Lion One were advised of sample locations or identification of any of the samples to be collected. Sample remained in the custody of Mr Taylor, the samples were documented, bagged and sealed with packing tape and were shipped by DHL couriers to ALS Chemex Laboratories in Suva Fiji for sample preparation. The prepared samples were sent to ALS in Brisbane for analysis for gold by 30g fire assay (ALS method Au-AA25). Table 13 lists the samples and description the gold assay results.

Table 13: MA Independent Sample Descriptions

Sample ID	Sample Description	g/t Au
MA_TV_01	Rock chip from Tuvatu Lode outcrop	13.65
MA_TV_02	Drillcore from TUDDH112; 282.4m to 282.8m	9.62

The assay results are consistent with the gold mineralization typical of the prospect. A previous sample (TU13421) assayed 12.5 g/t Au from the same section of drill core as MA_TV_02 although MA highlights that the sample lengths were different.

Figure 19: MA sampling Tuvatu Lode outcrop

12.3.2 Limitations

Mr Taylor only visited selected surface drill collars and surface outcrops. Access to the underground workings was not possible.

12.4 VERIFICATION OPINION

Based on the data verification performed, it is MA's opinion that the data reviewed is adequate for the purposes used in this technical report.

13 MINERAL PROCESSING AND METALLURGICAL TESTING

Metallurgical test work on mineralization mined during the underground exploration programme was conducted by Emperor Gold Mining for TGM. An ore parcel of Nasivi-SKL ore (968 tonnes) was dispatched to Vatukoula during Phase 1 for batch processing at Vatukoula and metallurgical test work. The ore treated averaged 3.63 g/t with a gold recovery of 82.74%. It was found to be only slightly refractory with 87% of the gold being recoverable via direct cyanidation. Test work also suggested that 30% of the gold could be extracted via a gravity circuit (TGM August, 2000).

During the second phase of underground work, 1,095 tonnes of ore from the UR1 South strike drive was sent to Vatukoula and treated via the same procedure as the initial Phase 1 bulk sample. Metallurgical results were found to be comparable to those for the first ore parcel. The ore treated was found to have a head grade of 4.79 g/t Au. This compared with a grade of 4.83 g/t calculated from channel sample data. It was found that 84% of the gold could be recovered via direct cyanidation. In flotation tests 87% of the gold was found to report to the concentrate and 86.7% recovery could be achieved via flotation followed by cyanidation. A total of 146 ounces of gold were produced from the ore parcel.

In September 1999, additional metallurgical testing was conducted with column leach and heap leach test work carried out to test the amenability of the ore to extraction via heap leach. A 20 tonne bulk sample of ore from the UR1 strike and rise development was dispatched to Vatukoula for column leach test work. The grade of the ore was determined to be 4.33 g/t but a high degree of variability was noted in grab samples. A representative sample of 565 kg was leached in a purpose built column for a period of 31 days to simulate dump leach conditions. Reconciled recovery for the ore was found to be 56.4%. A second sample of 457 kg was crushed to -20 mm prior to leaching for 37 days. The reconciled recovery for the crushed ore was 57.1%. The crushed sample exhibited a significant difference between reconciled and assayed recoveries, most likely due to the grade variability mentioned above. Reagent consumption for both trials was low to moderate for lime and cyanide respectively.

In March 2000 Metcon Laboratories were enlisted to carry out additional metallurgical test work on composite samples of ore from the UR1, UR2 and UR5 lodes. Samples were collected at regular intervals from along the backs of the strike drives on the various lodes and combined to form composite samples for the individual lodes. Test work included gravity concentration, cyanidation, grinding and flotation. Initial work was carried out on samples ground to 7 μ m. Recovery from gravity concentration ranged from 18.5% to 52.8%. Results for gravity concentration followed by cyanidation ranged from 81.7% to 91.7% recovery. Tests were carried out at coarser and finer grind sizes with some reduction in recoveries at the coarser 150 μ m grind size and only a small improvement at the finer 50 μ m grind size. Flotation tests were also carried out on each composite at 150 and 75 μ m grind sizes with a gold recovery of between 90.6 and 93.6% to a rougher flotation concentrate of around 15% by weight.

MA notes that the related consultants' reports covering the above metallurgical studies by AMMTEC Ltd, Metcon Laboratories, Orway Mineral Consultants and Amdel Limited are appended to the In-House Feasibility Study (TGM, August 2000) which is part of the Tuvatu data package provided by Lion One.

In 2012 metallurgical test work by Gekko Systems Pty. Ltd. of Ballarat, Australia confirmed the reliability of previous metallurgical test work and concluded that the various ores from Tuvatu are amenable to conventional crushing, grinding and flotation processing techniques. Gekko performed a number of studies on the crushing and grinding work indices of the ore, showing that the use of a

cone crusher following jaw crushing will be effective in reducing overall crushing and grinding costs. Gekko also performed flash flotation tests and a battery of tests using gravity concentration. Gravity recoveries averaged over 40%, and combined gravity and flotation ranged up to 94%.

Further optimization studies have commenced to evaluate a configuration that includes the combination of a cone crusher, two stage ball milling, in-line pressure gravity concentration, and two additional points of gravity concentration, followed by flotation at a coarse grind size and CIL leaching or direct sale of concentrates.

14 MINERAL RESOURCE ESTIMATES

A number of historical mineral resource studies have been carried out at Tuvatu by previous operators over the period from 1997 to 2010 (see Section 6.3).

The previous published resource has been developed with classic techniques suited to board zones of mineralization of relatively homogenous mineralization. Specifically the compositing of individual samples to one m down hole and utilising inverse distance cubed (ID^3) linear weighting techniques of the capped data.

MA considers that a two dimensional estimate using grade and thickness across the narrow vein is a better method. The model has to incorporate a level of conceptual interpretation (implicit modelling) as the veins are very narrow. Traditional cross section interpretation (explicit modelling) is near impossible.

The methodology used in this style of resource estimates is chosen as it facilitates better models of vein thicknesses and does not have the problems introduced by attempting to construct very narrow wireframes: vein walls crossing and too many small blocks. The 2D re-folded model provides a more realistic vein model ideal for underground design or open pit design where veins come to surface.

The vein model has been diluted to a minimum mining width of 1.2 m, there are examples where one sample was high and less than 1.2 m, and a neighbouring sample with elevated grade (>0.2 g/t) was incorporated, the intention was that locally the vein was diluted before estimation and not post estimation with zero grade.

14.1 APPROACH

The main consideration as to whether a 2D or 3D estimate should be performed is;

1. Are there differences in mineral domains horizontally within the vein and can separating the vein improve grade estimation and control of feed grades.
2. Does the mining equipment have the ability to mine smaller or multiple cuts across the vein? If not, but the estimates are better, then grades can be combined in a manner that makes the overall estimate more predictive. If there are great horizontal differences an engineering study could be considered to determine if there is an economic benefit to changing the mining method.

MA considers that there is no appreciable difference in mineralisation across the vein, which are very narrow (less than 1 m in places) and no mining selectivity across the vein is possible. Thus a two dimensional estimate of grade and thickness across the narrow vein is a better method to apply at the Tuvatu Gold Project. In essence the true thickness and grade (and geostatistics) of a vein domain are estimated in unfolded space, i.e. on a 2D grid. This vertical plane is sub-parallel to the vein direction, thus grades and thicknesses are absolutely tied to the informing samples/composites. The process of "unfolding" and "refolding" results in some smoothing of vein contacts, which may result in minor apparent spatial departures of the vein wireframes from some composite centroids.

14.2 SUPPLIED DATA

MA was supplied with Lion One’s drill database, with the database name: Database ExportDrillHoles.mdb with the following structure shown in Table 14.

Table 14: Master Database Structure

Table Name	Description	Record Count
Assay	Assay intervals and associated gold and silver results	71,633
Collar	Collar information associated with drill type and location	1,131
Lithology	Logged lithological units	9,152
SG Data	Bulk Density data from drill core samples	1,955
Survey	Down hole survey data	4,054
Weathering	Logged oxidation codes	48,871
Site_Tags	Interpreted veins identification tags from site	1,833

MA created a new table to store the vein intercepts in, veins were check in three dimensions, cross section and long section. MS Access queries were run to ensure mineralisation was not excluded adjacent to composites and un-necessary waste samples were not included. There are examples of material below 0.3 g/t being included however these tags are required to constrain and ensure vein continuity.

There were mineralised samples outside vein tags (Table 15). The one exception to the high grade being excluded is in SKL8 where a 6.51 m mineralised sample is very improbable. Two additional “long” samples are recorded in the data base and are included in the estimate as the results are in-line with expected grades possible from a “long” sample. MA recommends confirming the sample lengths in log books or physically in the core trays.

Table 15: Mineralised samples outside vein tags.

Hole_id	depth_from	depth_to	Au_ppm_BEST	zonecode	position
TUDDH-078	82.3	86	6.51	SKL8	Not included
TUDDH-42	32.5	37.5	1.58	M1	Included
TURC-21	7	10	0.63	M1	included

14.3 DIMENSIONS

Database extents (Table 16) are more extensive than the mineralised resource described in this report.

Table 16: Database Extents

Database	Min (m)	Max (m)	Extents (m)
Northing	3917051	3923892.0	6841.0
Easting	1874687.4	1878637.9	3950.5
RL	99.75	547	447.3
Hole Depth	0.88	600.6	NA

Although the Upper Ridges and associated north south veins cover a strike extent of 900 m (3920200 m N to 3921100 m N), individual veins have shorter strike lengths. The Western veins and Murau veins strike approximately 800m (1875750 m E to 1876650 m E) with a break between the Western veins and Murau of approximately 150 m.

14.4 GEOLOGIC INTERPRETATION

Tuvatu is one of several gold prospects known from the Sabeto area of north-western Viti Levu. Mineralization is structurally controlled and is hosted by a series of sub-vertical veins, shallow dipping veins and stockworks. The main mineralized zone (Upper Ridges) comprises eleven principal

lodes with a strike length in excess of 500m and a vertical depth of more than 300m (Figure 20). Another major zone of mineralization (Murau) strikes east-west and consists of two major lodes with a mapped strike length in excess of 400m. Although gold mineralization is primarily hosted in monzonite it can also occur in the volcanic units. Lodes are narrow, generally less than 1 m up to a maximum of 7 m, and ore grades are erratic. Lode mineralogy is varied, with most veins containing quartz, pyrite, and base metal sulphides. A total of 39 different lode structures were identified in the resource area including 11 lodes in the Upper Ridges area, 3 lodes in the Murau area, 4 lodes in the West area, 2 lodes in the Tuvatu area and the stockwork veins in the SKL area. A minimum of 5 intercepts are needed for a vein to be defined with a number of other lodes having been identified but remain to be further tested before inclusion in resource estimates.

Veins were identified as intercepts greater than 0.5 g/t Au, however due to the tight nature of the veins relatively few assays less than 1.0 g/t are incorporated. The low grade boundary allowed networks of narrow veins (1 mm to 200 mm wide) to be “bulked” into substantial vein intersections. In areas where the vein has propagated as a single thin veinlet assays as low as 0.3 g/t were incorporated as edge dilution, notably where veins/assay composites were less than 1m thick. Portions of the vein were selected based on lithology logs or interpreted strike extensions despite supporting assay data in these situations consisting of values below 0.3 g/t Au.

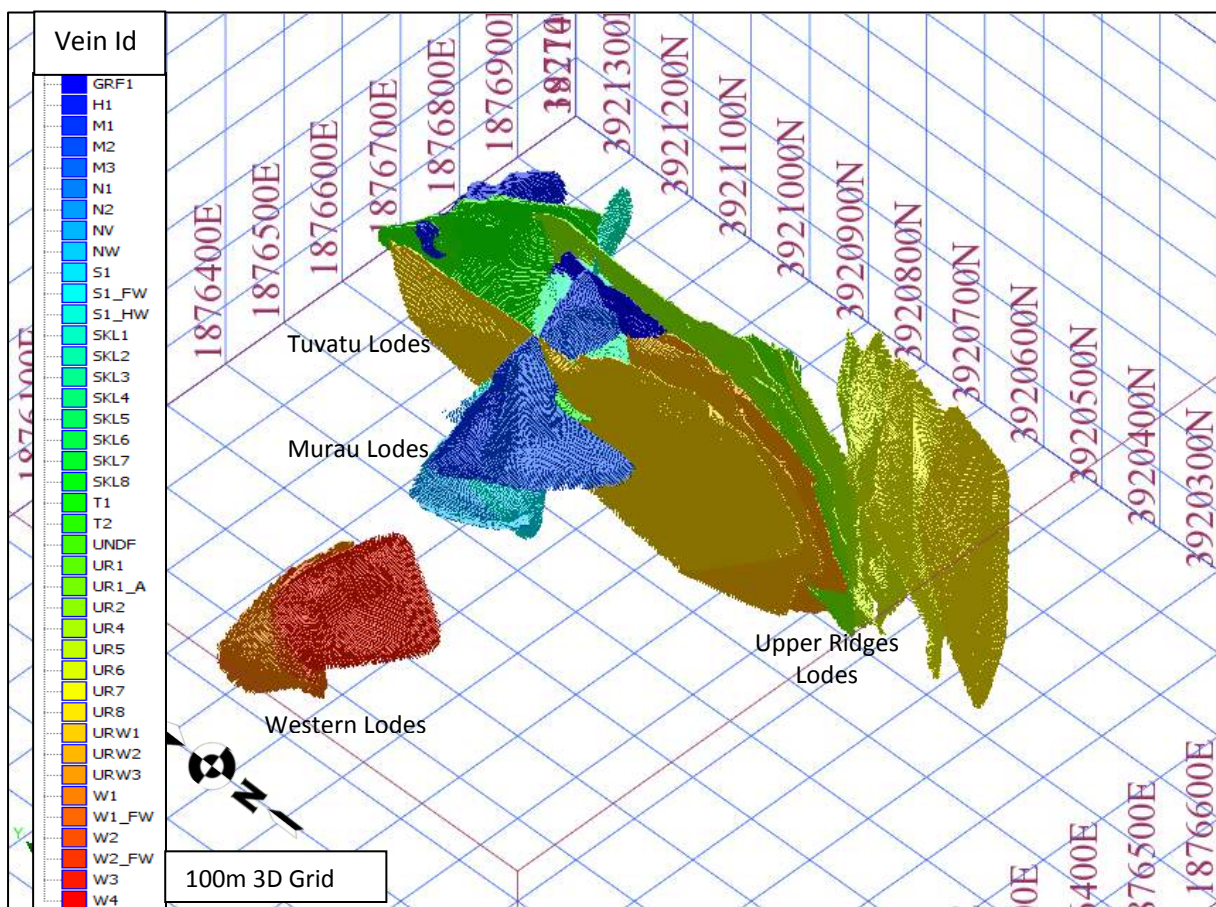

Figure 20: Tuvatu Lodes (Oblique view (45°E -45°))

14.5 DATA PREPARATION AND STATISTICAL ANALYSIS

Prior to a statistical analysis, grade domaining is normally required to delineate homogeneous areas of grade data, at Tuvatu the individual veins are assumed to represent sufficiently homogenous mineralisation. Statistical analysis does not take into account the spatial relationships of the data.

The purpose of statistical analysis is to define the main characteristics of the underlying grade distribution to assist with the geological and grade modelling work. This process is important as the statistics of the individual sample populations can influence how the grade data is treated and the application of the grade estimation techniques. For example highly skewed data may require special grade capping and indicator semivariogram analysis.

The drill hole database is stored in an MS Access relational database. The Tuvatu database is connected directly to Surpac for data display, vein compositing, wire-framing, unfolding, estimation refolding storing in a 3D block model.

Statistical analysis of the grade data was principally carried out using the Surpac™ Software package. Surpac™ was used to export composite drill hole data as a comma separated file (CSV) for importation into Supervisor™. More detailed spatial analysis (variograms) was conducted within Supervisor. The Supervisor package is an internationally recognised geological and mining software toolbox which incorporates geostatistical tools that can be used at all stages of the mining process from initial feasibility studies though to production control.

14.5.1 Drill Hole Spacing

Drill hole data spacing is variable within each domain. Above 50 m RL the drill spacing in Upper Ridges (UR) is reasonably tight on a 25 m grid and below 50 m RL the drill spacing increases to approximately 50 m grid. UR western lodes are less well drilled. Development exists on UR2, UR5 and GRF veins. Murau veins are shallower and are generally drilled at 25 m spacing.

14.5.2 Domains and Stationarity

A domain is a three-dimensional volume that delineates the spatial limits of a single grade population, has a single orientation of grade continuity, and is geological homogeneous and has statistical and geostatistical parameters that are applicable throughout the volume (i.e. the principles of stationarity apply). Typical controls that can be used as the boundaries to the domains include structural features, weathering, mineralization halos and lithology. Within the Tuvatu deposit individual veins were used to define the domain. It is understood that the average grade of veins vary along strike and down dip as a result of high grade shoots, which are controlled by search ellipses, variography, and the number of informing intercepts selected.

14.5.3 Compositing

The two-dimensional technique used by MA to estimate resources at Tuvatu uses a single down-hole (or along channel) composite sample extracted from the drill hole database for each intercept within the vein. True thickness was calculated using the overall dip and dip direction of the vein. It is assumed that the grade of the vein at each location is the grade of the intercept thus reducing concerns of volume variance and negating the need for constant length samples. Scatter plots showed no correlation between grade and thickness, thus grade and thickness are treated as independent samples.

14.5.3.1 Channel Samples

Channel samples were used to guide the location, grade and thickness of veins at surface. In areas of intense channel sampling or where channels were sampled twice only, one channel was selected to inform the estimate. The following are examples where one channel is selected.

- Channel 17 and 18 are parallel only channel 18 is used
- Channel 31 and 33 are parallel only Channel 33 is used

14.5.4 Summary Statistics

Summary statistics for vein gold and thickness by area are presented in Table 17, Table 18 and Table 19. Informing sample grades (uncapped) for the upper ridges veins range from 2.16 g/t Au and 0.52 m for UR7 and 13.53 g/t and 4.65 m URW1 (Table 17), in the Murau Area veins range from 1.89 g/t Au and 1.95 m thick for Nasivi West to 3.74 g/t Au and 2.01 m thick for Snake vein (Table 18) and SKL veins have a very high vein at 23.36 g/t (Table 19).

14.5.5 Grade Capping

Capping is the process of reducing the grade of the outlier sample to a value that is representative of the surrounding grade distribution. Reducing the value of an outlier sample grade minimises the overestimation of adjacent blocks in the vicinity of an outlier grade value. At no stage are sample grades removed from the database if grade capping is applied.

Veins with more that contain more than 50 intercepts were assessed for outliers, via histograms log probability plots and metal loss. Uncapped and capped summary statistics are presented in Table 20 and graphically represented in Figure 21. Veins with less than 50 intercepts were consider unreliable representations of the distribution, and the grade cap was selected at the 97.5th percentile which often resulted in only one value being capped. Grade caps applied are presented in Table 21.

Table 20: Un-capped and capped summary statistics per vein with more than 100 intercepts

14.6 VARIOGRAPHY

The most important bivariate statistic used in geostatistics is the semivariogram. The experimental semivariogram is estimated as half the average of squared differences between data separated exactly by a distance vector 'h'. Semivariograms models used in grade estimation should incorporate

the main spatial characteristics of the underlying grade distribution at the scale at which mining is likely to occur.

The semivariogram analysis was undertaken in Surpac within each major vein; both gold and thickness were considered as separate variables. Variograms analysis was undertaken in unfolded space, thus only the plunge was defined through variography analysis. 2D experimental variograms are modelled using a nugget (C_0) and two spherical models (C_1 , C_2), occasionally one spherical model was sufficient, particularly for modelling the thickness variograms. The modelled variogram geometry is consistent with the interpreted mineralisation wireframes due to the unfolding process, a plunge component is incorporated where identified and modelled accordingly. The overall ranges modelled for the major axis are in excess of the drill spacing, and appropriate anisotropy fitted to the semi-major axis. The minor axis is not considered as all veins have been composited across the veins and it is not required.

Gold and thickness variogram sills were standardized to 1. Nugget effects for gold were generally low to moderate, ranging from 0.1 to 0.51, and the range (A_2) of the variograms varied from 20 m to 85 m for gold variogram models. Thickness variogram nuggets ranged from 0.1 to 0.65 and more commonly only required one structure to model, with variogram ranges from 20 m to 90 m. UR and URW veins displayed far greater continuity for thickness with ranges of 200 m to 500 m for their second structure.

The major axis of the ellipse is orientated in the unfolded plane. North striking veins are unfolded to the X axis, east striking veins unfolded to the Y axis and flat veins unfolded onto the Z axis. The plunge is the angle above (<90°) or below (>90°) the horizontal.

Variogram parameters are summarised in Table 22 (gold) and Table 23 (thickness).

14.7 GRADE ESTIMATION

The drilling and channel data were examined using Surpac™ software package, using the MA proprietary Narrow Vein Modelling system.

The MA Proprietary System for Narrow Vein Modelling estimates the grades and true widths of veins. This is done in unfolded space using 5 m x and y grid spacing. The estimation area is extended beyond the outer data points by expansion of a fixed distance to create a boundary perimeter; the boundary is then smoothed with the result that the expansion is reduced to less than the target thickness at the extremities. The expansion distance is therefore a maximum, rather than a fixed value. The expansion for Tuvatu is maximum 20 m. Thickness at the extension boundary is set to 0.2 m.

Grade estimations are made using 5 different methods so that the results can be compared; these are Nearest Neighbour (capped), Inverse Distance Squared (capped), Ordinary Kriging (uncapped) and Ordinary Kriging (capped) and metal content (gram-metres). True widths are estimated directly using Ordinary Kriging (no capping).

One block model was created, covering the entire project. The final 3D block model utilised 9.6 m cubic blocks sub-blocked down to 1.2 m cubes.

14.7.1 Methodology

MA Proprietary System for Narrow Vein Modelling was used which consists of the following steps.

1. **Database** – validation of the drill-hole database. Selection of down-hole composites lengths, for each vein.
2. **Intercept Selection.** The drill hole data is displayed in section and elevation slices showing assays. Intercepts are selected and coded for each vein based on the following selection criteria, in priority order;
 - a. Grade – select intervals with a value above cut-off, in this case 0.5 g/t Au. Also, internal waste of < 0.3 g/t Au intervals and/or geologically continuous intervals just below cut-off may be included.

- b. Continuity – waste (<0.5 g/t Au) values in the projected plane of continuity of a particular vein being modelled will be coded as that vein.
 - c. No assays but a “vein” lithology code in the expected location
 3. **Basic Statistics and Upper Cuts.** The basic statistics of the vein composites for each vein are then examined using basic statistics for grades, true width and gram.metres (metal). The mean, median, standard deviation and variance are calculated for both normal and log-transformed data. A cumulative probability plot is prepared for each data set in both normal and log-transformed formats. Breaks in the plot indicating more than one population are highlighted and their spatial position relative to the total data set examined in 3D space. If more than one population is considered possible, the total population is decomposed into its component populations and these are highlighted again in 3D space. If a small high-grade population is indicated, and this cannot be physically domained from the remainder, then an estimate with an upper cut will be included in the resource estimates.
 4. **Unfolding and Variography.** The vein composites are unfolded into a single plane, such that NS striking veins are projected to the X axis, EW veins projected to the Y axis and flat veins projected to the Z axis. The original coordinates are stored in the model so the model may be refolded post estimation. Variography is then undertaken in this 2D space. Values for anisotropy and a variogram models are recorded for gold and thickness. Where no directional variograms are clearly determined (as commonly happens with less than 50 data points, or where the data is unevenly distributed) isotropic variograms were used or variograms from similar veins sets where utilised.
 5. **Unfolded Grid Model and Extension** – Generates a model of the vein centre using the coded intercepts, and estimates grades, vein true widths and gram.metres. This is done in unfolded space using selectable x and y grid spacings. The estimation area is extended beyond the outer data points by expansion of a fixed distance (in this case 20 m) to create a boundary perimeter, the boundary is then smoothed with the result that the expansion is reduced to less than the target expansion at the extremities. The expansion distance is therefore a maximum, rather than a fixed value. In extreme cases, say where the extension is based on a single drill hole, no extension will occur at all. Expanded wireframes are checked in 3D space to ensure the expansion does not intersect waste drill holes. The thickness of this boundary is set to 0.2m. This prevents an overflow of grade contours past the limits of estimation. The grade estimates are made using 5 different methods so that the results can be compared. These are Nearest Neighbour Capped, Inverse Distance Squared Capped, Ordinary Krige Uncapped and Ordinary Krige Upper Capped and gram.metre estimates. The true widths are estimated directly using Ordinary Kriging.
 6. **Minimum Width application and consequent Grade Dilution** – Every 10 x 10m block in unfolded space with a vein width (in the perpendicular direction to strike) less than 1.2m is set to a width of 1.2m. The grades for each block are then diluted according to the original width and waste grade (0.0 g/t), using the following formula:

$$\text{Diluted grade} = (\text{grade} \times [\text{true thickness}/\text{minimum thickness}]) + (0 \text{ g/t} \times [\text{dilution thickness}/\text{minimum thickness}])$$

Blocks with a width greater than 1.2 m have no change. This dilution will raise the tonnes and reduce the grade of the model; however, the total ounces of gold will remain about the same. The process of applying a minimum width is to reflect the minimum mining width and apply an appropriate dilution where veins are thinner than the mining width.

7. **Refolding and True Width Correction** – The grid is re-folded to its original 3D position. This is done by replacing the unfolded coordinates with the stored real coordinates. Some smoothing of the surface using surface modelling algorithms (not geostatistics) is undertaken; this removes local spikes and steps due to clustering of data. Changes are small, generally less than half the grid spacing. The “slope” of the surface in 3D space relative to the 2D surface is then measured as a percentage gradient; this value is recorded as it is similar to that used in “Connolly Diagrams” (Schwartz 1986). The True Width value is then corrected using this factor. Note that “slope” value is measured at each node of the grid and is a function of the surface geometry; the more the surface moves from the projection plane the greater the correction – in effect an “auto-correction”. This is much better than using an average strike and dip for the surface (too general), a drill core measurement (too local) or geostatistics (too smoothed).
8. **Solid Creation** – The 3D centre plane of the vein is then converted to a closed 3D solid. Footwall and hanging wall surfaces are created by translating the 3D centre plane half the width of the vein to create footwall and hanging wall surface. These are then joined at the edge, which is a common boundary, to create a vein solid. If more than one vein is being estimated, then the interaction between the resultant solids is examined and portions of the minor veins removed via “clipping”.
9. **Block Model** – The volumes from the final closed 3D solids are used to flag blocks in the final 3D block model for each vein. The variables from the solids, including grades, widths, slope, kriging variance, number of informing samples, nearest drill hole name and distances, etc., are all stored in the block model. Each vein block is given a vein name and number.
10. **Bulk Density** – The bulk densities for each block below the topographical surface are set to a constant value.
11. **Missing Blocks** – blocks that are not present are flagged as air (above the original topography), pit (mined out in an open pit), stoped (removed by underground mining).
12. **Mineral Resource categories** – the resource categories are defined in long-section view for each vein, based on a combination of the number of informing samples, sample distances and kriging variance. The mineral resource categories are stored in the block model field.
13. **Validation** – The values within the block model are compared to the informing drill composites. Basic statistics for block model and drill composites are compared. Distributions of grades in space (by elevation and northing) are compared. Blocks nearest to drill holes are compared with the informing drill holes. The estimates using the different estimation methods are compared in total and above cut-off.
14. **Reporting** – the resource can be reported by resource category, by vein, by cut-off grades, by different methods (sensitivity to method and upper cuts), by elevation (tonnes per vertical m), by x and y dimensions.

14.7.2 Block Model

The Tuvatu block model uses regular shaped blocks measuring 9.6 m x 9.6 m x 9.6 m (Table 24). The choice of the block size was patterned with the trend and continuity of the mineralisation, taking into account the dominant drill pattern and size and orientation of the veins. The orientation of the block model is normal to the direction of the local grid. To accurately measure the volume of the mineralized wireframe inside each block, volume sub-blocking to 1.2 m x 1.2 m x 1.2 m was used. Blocks above the topography were tagged and excluded from the model estimation.

Table 24: Block Model Extents

Type	Y	X	Z
Minimum Coordinates	3920000	1875500	-250
Maximum Coordinates	3921305.6	1876901.6	508.4
User Block Size	9.6	9.6	9.6
Min. Block Size	1.2	1.2	1.2

14.7.3 Informing Samples and Search Parameters

Informing samples are composited across the vein, providing a local average across the vein width before estimation. Using average grades across a vein requires careful consideration of the number of informing samples used to prevent over smoothing of the estimate. A minimum of one vein composite and a maximum of eight vein composites were permitted to inform a block. The number of samples per vein composites depends on the thickness of the vein and the orientation of the drill hole to the vein. Search radii were found to be optimal at or near the distance that the variogram reached the sill. Thus the variogram ranges will be utilised in the maximum search distances (Table 25). The isotropy apparent in the variogram analysis is reflected in the search ellipse. Only one pass was used to inform the blocks.

Table 25: Search Parameters

Veins	Search Distance (Au)	2D Anisotropic ratio (Au)	Search Distance (m)	2D Anisotropic ratio (m)
GRF1	20	1	25	1
H1, T1 T2	50	1	50	1
URW1, URW2	85	1.75	100	2
URW3	85	1.75	100	2
UR1	65	2.2	100	1

UR2	65	2.2	100	1
UR4	90	1.95	90	1.95
UR5	60	2	50	1
UR6, UR7 UR8	90	1.95	90	1.95
M1, M2, M3	100	1.5	60	2.1
N1, N2, NV, NW	50	1.5	60	2.1
S1, S1_FW, S1_HW	50	1.5	60	2.1
SKL1	20	1	25	1
SKL2, 3,4,5,6,7,8	25	1	25	1
W1, W2, W2_FW, W1_FW, W3,W4	50	1	50	1

14.7.4 Discretisation

The Kriging estimate used a 4 x 4 x 1 discretisation (XYZ), giving discretisation nodes spaced evenly within the block, the projection plane direction has no thickness (2D unfolded space) thus one discretisation point is applied.

14.7.5 Block Model Attributes

Interpreted mineralised veins were coded to the block model. Sufficient variables were added to allow grade estimation, resource classification and reporting (Table 26). Blocks above the original topography were coded as air and not estimated. Blocks that have been mined were flagged in the final block model; these blocks were estimated for reconciliation purposes. To simplify and reduce the size of the block model several attributes were removed from the final model. Final block model attributes are defined in Table 27.

Table 26: Block Model Attributes

Attribute Name	Type	Background	Description
dist_near	Real	0	distance to nearest sample
gold_f_gm	Real	0	derived from g.m
gold_ids	Real	0	IDS value for gold uncut, diluted for min thickness
gold_krig_capped	Real	0	krig value for gold top c according to vein, diluted for min thickness
gold_krig_uncapped	Real	0	krig value for gold uncapped, diluted for min thickness
gold_nn	Real	0	gold value of nearest sample, diluted for min thickness
gold_undiluted_uncapped	Real	0	original gold krig uncapped value undiluted by minimum thickness
hole_id	Character	UNDF	name of nearest drill hole
hole_length	Real	0	length of nearest sample downhole
krig_var	Real	0	kriging variance
minimum_thickness	Real	0	horizontal width across whole vein set at a minimum
num_samp	Integer	0	number informing samples
silver_krig_capped	Real	0	krig value for silver top c according to vein, diluted for min thickness
silver_nn	Real	0	gold value of nearest sample, nearest neighbour
silver_undiluted_uncapped	Real	0	original silver krig uncapped value undiluted by minimum thickness
slope	Real	0	percentage gradient of the vein in 3D, capped at 300%
true_width	Real	0	true width across whole vein
vein_name	Character	UNDF	name of vein
x_width	Real	0	horizontal width across whole vein in x direction

Table 27: Final Block Model Attributes (exported)

Attribute Name	Type	Background	Description
density	Real	2.57	bulk density
dist_near	Real	0	distance to nearest sample
gold_f_gm	Real	0	derived from g.m
gold_krig_capped	Real	0	krig value for gold top c according to vein, diluted for min thickness
gold_undiluted_uncapped	Real	0	original gold krig uncapped value undiluted by minimum thickness
hole_id	Character	UNDF	name of nearest drill hole
krig_var	Real	0	kriging variance
mined	Integer	0	0 insitu, 1 mined
minimum_thickness	Real	0	horizontal width across whole vein set at a minimum
num_samp	Integer	0	number informing samples
res_cat	Integer	3	1 measured, 2 indicated and 3 inferred
silver_undiluted_uncapped	Real	0	original silver krig uncapped value undiluted by minimum thickness
true_width	Real	0	true width across whole vein
vein_name	Character	UNDF	name of vein
x_width	Real	0	horizontal width across whole vein in x direction

14.7.6 Validation

Block models were validated by visual and statistical comparison of drill hole and block grades and through grade-tonnage analysis. Initial comparisons occurred visually on screen, using extracted composite samples and block models. Two of the major veins are presented in Figure 24 and Figure 25, and additional vein long section views are presented in Appendix 3.

Alternative estimation methods (Table 28) were utilised to ensure the krig estimate was reporting a global bias, such as nearest neighbour and ID² and back calculated grades from grams x m (g.m) estimates. The alternate estimates provided expected correlations. Nearest neighbour shows less tonnes and higher grade as it does not employ averaging techniques to assign the block grade. The ID² estimate is closer to kriging as it does use averaging weighted by distance, but cannot assign

anisotropy nor have the ability to decluster the input data. The gold grades back-calculated from g.m appeared over smoothed, a likely consequence of using the thickness variogram for both g.m and thickness. The ordinary krig estimate is the most reliable due to the ability of kriging to decluster data and weight the samples based on a variogram (which incorporates anisotropy).

Table 28: Alternate estimation results at nominated cut-offs

Cut-off grade g/t Au	Ordinary Kriging		Using g.m to back calculate grade		Inverse distance squared		Nearest Neighbour	
	Mt	Au g/t	Mt	Au g/t	Mt	Au g/t	Mt	Au g/t
1.0	4.97	5.7	5.49	6.0	5.02	5.5	4.09	7.1
3.0	2.61	9.2	3.10	9.1	2.63	8.8	2.13	12.0

The alternate estimation methods are presented by vein Figure 22. Note SKL7, URW1 with extreme outliers significantly affects the ID² and NN estimates quite dramatically. SKL7 (11 comps, 172.9 g/t max) and URW1 (65 comps, 285.5 g/t max) have extreme outliers relative to the general grade of the veins.

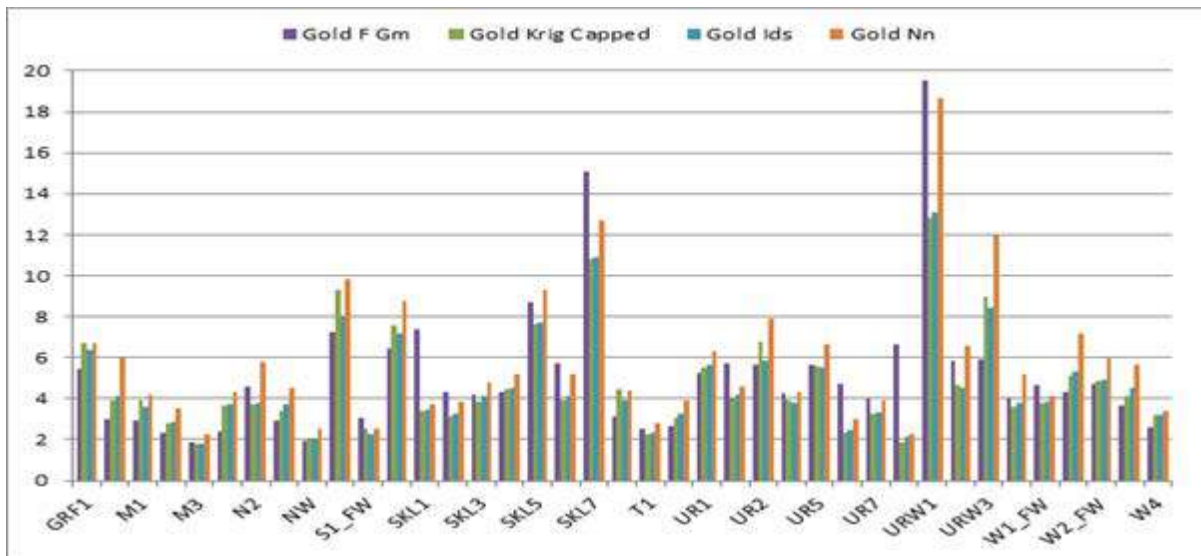

Figure 22: Veins Grades by gram.metre (purple), krig estimated grade (green), Inverse distance squared (blue) and nearest neighbour (orange)

Vein thickness estimates are particularly troublesome for vein sets not striking north-south, east-west or flat, such as the Nasivi vein and Snake vein sets (“flatmakes”). These vein sets are oblique and shallow to moderately dipping, and informed by very few intercepts, one of which is usually thicker and high grade. These veins are over estimated in thickness and represent a small fraction of the overall tonnes. Thickness capping could have been applied to these vein sets to limit overestimation, but the low number of samples made assessment of caps difficult, the estimated grades within these shallower dipping veins appears reasonable.

Reflecting the uncertainty in estimation, Nasivi veins are classified as inferred. T2 and H1 are oblique veins but are steeply dipping thus the vein thickness is better estimated, but do show some overestimation. Using rotated block models would be a solution to the problem of calculating true thickness, however a compromise of block model orientation had to be reached as one un-rotated model is required for mining optimisation.

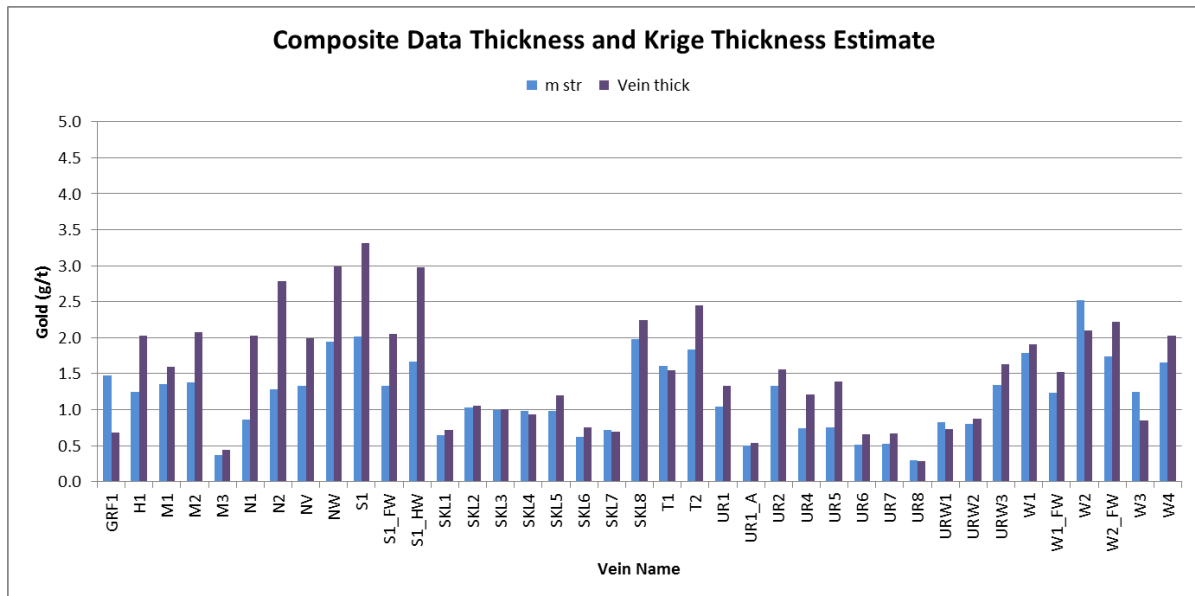

Figure 23: Vein thickness, drill data (blue) estimated (purple)

MA recommends further work (drilling) targeting oblique veins, such as Nasivi, Snake and Tuvatu lodes. At the completion of drilling the significance of the vein size should be assessed. If these veins become sufficiently large, a rotated block model should be considered to better enable the estimation of thickness, or a cap should be applied to the thickness estimate.

MA highlights a high grade shoot defined in URW1 (Figure 25). There is evidence for shoots within this lode but not as high grade as the two intercepts 100 g/t and 252 g/t Au might suggest, the supporting intercepts, (19.78 and 81.90 g/t Au) provide guidance on the size and potential grade. This vein is only 0.73m wide on average, thus dilution will be a major factor in the final grade. Currently a minimum mining width of 1.2 m with 0 g/t Au dilution has been applied to the model. Only the top of this high grade shoot is classified as Indicated.

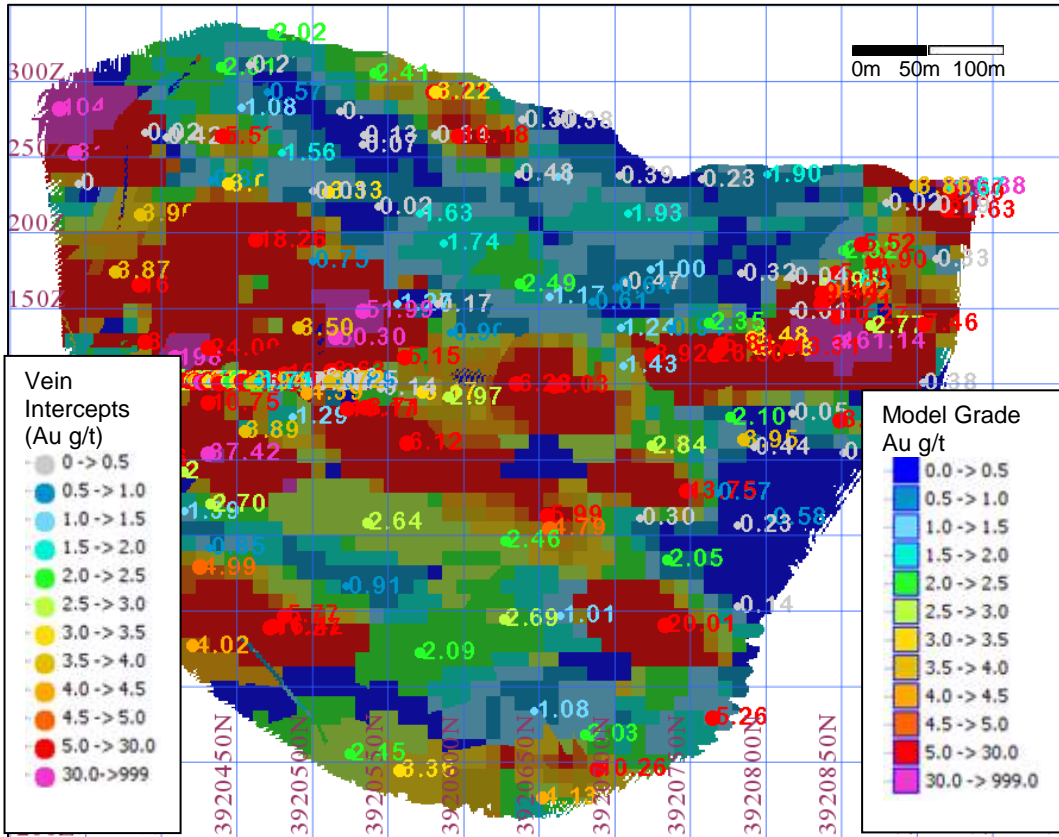

Figure 24: UR2 Estimated Gold (long section view)

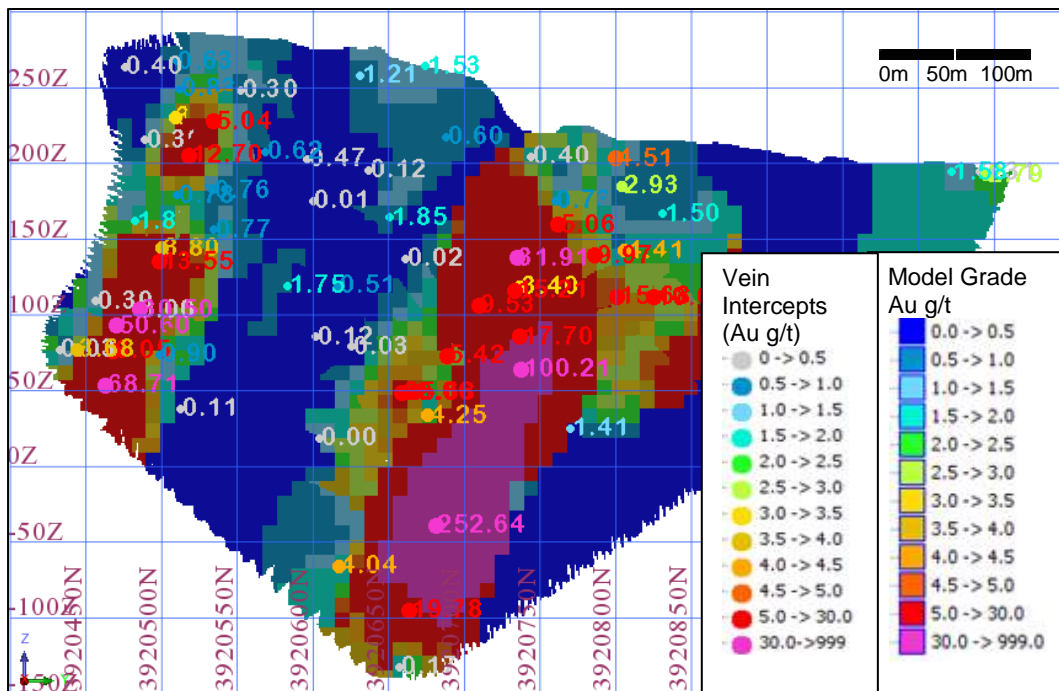

Figure 25: URW1 Estimated Gold (long section view)

14.8 ECONOMIC CUT-OFF PARAMETERS

Resources within 75 m of the surface have been stated above a 1 g/t Au cut-off, and resources below 75 m of the surface have been reported above a 3 g/t Au cut-off.

The resource available for potential surface mining has assumed a pit design with 45 degree ultimate pit slope, a US\$1.60 per tonne mining cost, 500 tonnes per day production and an assumed 95% mining recovery and 5% mine dilution.

The resource available for potential underground mining assumes a vein will have narrow widths from 1 m to 8 m. The assumed mining method is Shrinkage stoping or hand held miners: both methods are selective mining methods ideal for high grade, steeply dipping narrow deposits. Selective mining will maximize recovery and minimize dilution. An advantage of a shrinkage operation is that no back fill is required. The average stope parameters are 60 m long x 60 m tall x vein thickness. Assumed required head grade is 5.0g/t Au and as is shown in Figure 26 the average head grade above a 3g/t cut-off is 9.3 g/t in the indicated resource. It is assumed low grade ore (<5g/t) mined during development will be stock piled.

Table 29: Resource at various cut-offs depicting sensitivity to cut-off

Resource Category	Cut off	Indicated			Inferred		
		material (t)	Au (g/t)	Au (oz)	material (t)	Au (g/t)	Au (oz)
Surface Mining Potential - Within 75m of surface	>0.5	734,000	3.0	72,000	612,000	3.61	71,000
	>1.0	609,000	3.5	69,000	513,000	4.17	69,000
	>2.0	384,000	4.7	58,000	328,000	5.66	60,000
	>3.0	263,000	5.8	49,000	228,000	7.05	52,000
	>5.0	121,000	8.0	31,000	107,000	10.73	37,000
Underground Mining Potential - Below 75m of surface	>0.5	1,488,000	6.0	285,000	2,860,000	5.44	501,000
	>1.0	1,335,000	6.6	282,000	2,509,000	6.10	492,000
	>2.0	1,051,000	7.9	268,000	1,827,000	7.83	460,000
	>3.0	839,000	9.3	251,000	1,278,000	10.14	416,000
	>5.0	562,000	12.0	216,000	766,000	14.34	353,000

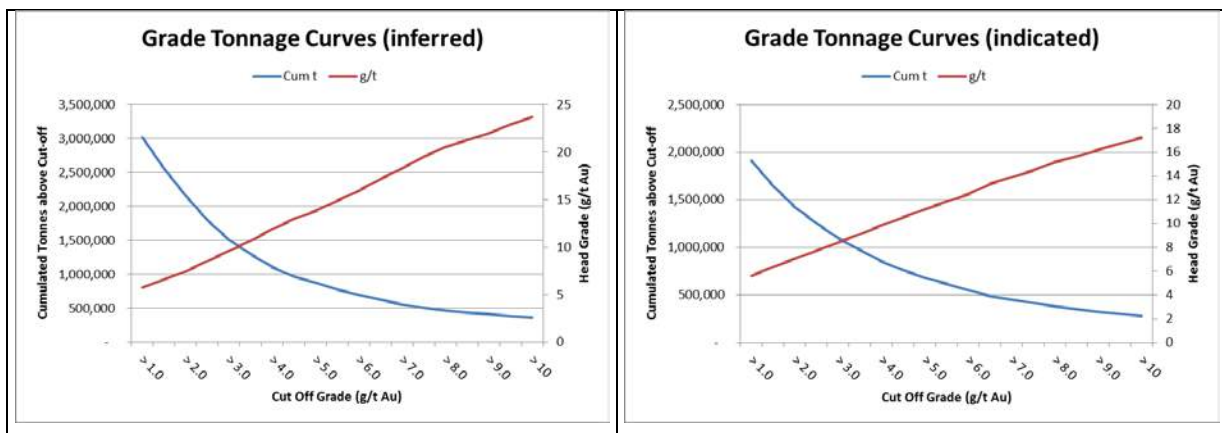

Figure 26: Tuvatu Grade Tonnage Charts

The grade tonnage chart Figure 26 indicates the global indicated and inferred tonnes and grade above a cut off will provide a head grade of approximately 5 g/t Au.

The global resource reported above various cut off is presented in Table 30, at the higher cut off for all material of 3 g/t Au there is an indicated resource of 1,101,000 tonnes at 8.46 g/t Au for 299,500oz and an inferred resource of 1,506,000 tonnes at 9.7 g/t Au for 468,000 ounces of Au.

Table 30: Tuvatu Resource Reported at various cut-offs

Cut-Off g/t	Indicated			Inferred		
	material (t)	Au (g/t)	Au (oz)	material (t)	Au (g/t)	Au (oz)
1.0	1,943,000	5.61	350,300	3,022,000	5.8	561,000
2.0	1,435,000	7.07	326,200	2,156,000	7.5	520,000
3.0	1,101,000	8.46	299,500	1,506,000	9.7	468,000
5.0	683,000	11.25	247,000	872,000	13.9	390,000

The reporting of tonnages and grade figures reflects the relative uncertainty of the estimate, and rounding to the appropriately significant figures have been reported, some discrepancy in the addition of rounded figures may occur.

14.9 ASSUMPTIONS FOR 'REASONABLE PROSPECTS FOR EVENTUAL ECONOMIC EXTRACTION'

Assumptions for reasonable prospects for eventual economic extraction applied to this deposit include but may not be limited to the following:

- Gold pricing at US\$1324.75, 12mth average to April 2014 (Kitco.com)
- Assumed open pit mining costs of \$1.60 per tonne;
- Assumed underground mining costs of \$40.00 per tonne;
- Assumed processing costs of \$20.00 per tonne;

Mineralised veins come to surface providing potential for open pit extraction. This style of mineralisation typically only lends itself to small open pits, thus potential open pit material is limited to within 75 m of the surface and a 1 g/t Au cut off is applied.

Material below 75 m of the surface is considered amenable for underground mining, either hand held or shrinkage mining. Underground mining costs are higher and require a higher cut-off grade. A cut-off of 3 g/t Au is considered reasonable based on similar small scale underground operations.

14.10 BULK DENSITY

A total of 1955 bulk density measurements were reported from drill hole core at Tuvatu, with an average reported bulk density of 2.61 t/m³ (Table 31). The statistical average of the bulk density measurements is assigned to all lithologies for this mineral resource estimate. This is lighter than the bulk density used in the 1998 NI43-101 (A-Izzeddin 1998) of 2.83 t/m³ based on 171 samples.

Table 31: Bulk Density Statistics

Basic Statistics	All Density Readings	Vein Density (subset)
	t/m ³	t/m ³
Count	1955	181
Minimum	1.86	2.07
Maximum	3.22	2.96
Average	2.61	2.57
Median	2.63	2.60
Mode	2.67	2.64
Standard Deviation	0.18	0.18

Bulk density data is stored in the drill hole database with a rock type code associated with each reading (Table 32), the majority of material is logged as either monzonite (MZ) or medium grained monzonite (MMZ) each reporting average densities of 2.61 t/m³ and 2.62 t/m³ respectively. Mineralised samples are likely to be from vein breccia (VBX) or unaltered veins (UV) with a density of 2.58 t/m³ and 2.50 t/m³ respectively.

Table 32: Bulk Density by Rock Type

Rock Code	Count	Average t/m ³
AN	224	2.63
AP	1	2.28
BL	32	2.58
CV	1	2.19
MMZ	906	2.62
MZ	687	2.61
PG	1	2.76
TF	1	2.49
UV	54	2.50
VBX	46	2.58
"Null"	2	2.72
Total	1955	2.61

Density values for mineralisation were extracted from the drill hole database and provided 181 sample within defined mineralisation. The average of mineralised samples used in the definition of the wireframe interpretations is 2.57 t/m³ (Table 31), this is similar result to the average of 46 VBX and 54 UV samples. The bulk density assigned to mineralisation is 2.57 t/m³. Waste material is assigned the average bulk density of the monzonite (2.61 t/m³). Note: the average density of all measurements at Tuvatu is 2.61 t/m³.

14.11 MOISTURE

No measurements were recorded; all reported tonnes are dry metric tonnes.

14.12 MINING AND METALLURGICAL FACTORS

No mining factors have been applied to the in situ grade estimates for mining dilution or loss as a result of the grade control or mining process. No metallurgical factors have been applied to the in situ grade estimates.

14.13 RESOURCE ESTIMATE AND CLASSIFICATION

Based on the study herein reported, delineated mineralization of the Tuvatu Resource is classified as a resource according to the definitions from CIM Definition Standards (2010):

"A Mineral Resource is a concentration or occurrence of diamonds, natural solid inorganic material, or natural solid fossilized organic material including base and precious metals, coal, and industrial minerals in or on the Earth's crust in such form and quantity and of such a grade or quality that it has reasonable prospects for economic extraction. The location, quantity, grade, geological characteristics and continuity of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge."

A breakdown of the Tuvatu Project resource estimate by resource category is provided in Table 33.

Table 33: 2014 Tuvatu Resource Estimates

Resource Category		Indicated			Inferred		
Metrics		Tonnes	Grade	Ounces	Tonnes	Grade	Ounces
Cut off	Selection Criteria	t	Au g/t	Au oz	t	Au g/t	Au oz
1 g/t Au	Surface Mining Potential - Within 75m of surface	609,000	3.5	69,000	513,000	4.2	69,000
3 g/t Au	Underground Mining Potential - Below 75m of surface	839,000	9.3	251,000	1,278,000	10.1	416,000
Total		1,448,000	6.9	320,000	1,791,000	8.4	485,000

For the classification of Mineral Resources for the Project, the following definitions were adopted and applied to each domain separately:

14.13.1 Measured Mineral Resource

No measured mineral resources are defined at Tuvatu. The underground development sampling shows highly variable grades over short (3 m) distances, indicating that local estimation of grades will be difficult.

14.13.2 Indicated Mineral Resource

Defined as those portions of the deposit for which grade, quantity and densities can be estimated with confidence sufficient to allow the appropriate applicator of technical and economic parameters to support mine planning and evaluation of economic viability. The indicated portions of the resource are based on detailed geological information gathered from surface and underground drilling, underground workings and mapping. The prescribed drill spacing required was 25 m x 25 m and can demonstrate a high level of confidence in the geological continuity of the mineralization. Estimation statistics were used to guide the decision, Krige variances of block within the indicated category fall within the range of 0.15 to 0.4 and must not exceed 0.5. A few higher variance blocks may be included if a structural trend is present. The majority of blocks must have a sample location within 40 m, the average distance to nearest samples for all indicated blocks is 20 m. Blocks are informed by minimum of 6 vein composites.

14.13.3 Inferred Mineral Resource

Defined as those portions of the deposit which quantity and grade can be estimated on the basis of geological evidence and limited sampling, providing reasonably assumed continuity of quantity and grade. The estimates are based on geological evidence gathered from drill holes. The estimate inferred resource is defined with a drill spacing of greater than 25 m x 25 m. The inferred portions of the deposit are sampled with a fewer number of intersections but demonstrating a reasonable level of geological confidence. Inferred resources have an average distance to the nearest sample of 30 m and are informed by an average of 4 vein intercepts.

14.14 COMPARISON WITH PREVIOUS ESTIMATES

14.14.1 Comparison with Previous Estimates

Historical resource and reserve estimates are reported in "Technical Report and Resource Estimate on the Tuvatu Gold Property, Viti Levu, Fiji" (the "Technical Report") dated Oct. 1, 2010, and filed by the Company on SEDAR on November 26, 2010. The 2010 resource (Table 34) as estimated by P&E Consultants was published in the above report.

Table 34: 2010 Resource Estimate (2g/t Cut Off) for the Tuvatu Gold Project.

P&E Consultants 2010	Indicated			Inferred		
	Tonnes	Grade g/t	Au ozs	Tonnes	Grade g/t	Au ozs
Sulphides	760,000	7.05	172,000	2,502,000	5.78	465,000
Oxides	0	0	0	116,000	4.15	15,000
TOTAL	760,000	7.05	172,000	2,618,000	5.71	480,000

The 2010 resource was reported at a cut-off of 2 g/t Au. The current understanding is that Tuvatu would be amenable to several small open pits down to a depth of 75 m below surface, with an assumed cut off of 1 g/t Au. The remaining resource more than 75m below surface would be amenable to underground development with an assumed cut off of 3 g/t Au. The current resource (Table 35) represents an increase in Indicated and reduction in Inferred as a result of infill drilling undertaken by Lion One. The indicated ounces have increased by 148,000 to 320,000 ounces and inferred has increased by 5,000 ounces.

14.15 DISCUSSION ON FACTORS POTENTIALLY AFFECTING MATERIALITY OF RESOURCES AND RESERVES

The following factors could potentially impact on the materiality of the mineral resource estimate:

- Infill drilling will tighten control on interpolated thicknesses of the veins;
- Distal proportions of the resource are extrapolated using parameters defined in MA's Propriety Narrow Vein Modelling software. These projections were inspected by Lion One and MA and while there is limited geological evidence for the extrapolation, it is reasonable to expect the veins continue. Further extension drilling is required to support the extension of the inferred continuity of the veins.
- Local faulting is identified at the Tuvatu project and these structures are considered to have minor off-sets;
- An assumed mining width of 1.2 m has been applied to the resource; mining dilution has been incorporated at a 0 g/t grade. The final mining width achieved will have an impact on the narrow veined mineralisation tonnes and grade.
- Underground development will provide close spaced channel samples, it is likely these samples will show highly variable grades within the veins, as seen in the historical underground channel samples

MA notes Lion One has effectively complied with the requirements of the Department of Environment, (DE) Native Land Trust Board (NLTB) and the Mines and Mineral Resources Department (MRD)

- Lion One has completed an Environmental Impact Assessment (EIA) and has obtained approval by the Department of Environment in Fiji. The DE has recommended mining to the MRD.
- Lion One has finalised negotiations with the NLTB, who represent the landowners regarding the surface licence and they have also notified MRD.
- The proposed grant of the mining licence has been advertised in the papers for the statutory period of time and there were no objections.
- All community and stakeholder negotiations have reportedly gone well with community and stakeholder's supporting mining at Tuvatu.
- The EIA and the surface licence were pre requisites to the grant of the mining licence. The social implications were addressed in the EIA and were satisfactory to all stakeholders. Lion One is currently negotiating with the government regarding royalties etc. as some companies have received reductions in various payments and taxes in the past to start up operations.

14.16 MINERAL RESOURCE ESTIMATE STATEMENT

The categorised Mineral Resources for the Tuvatu Project have been classified as indicated and inferred confidence categories on a spatial, areal and zone basis and are listed in Table 35.

Table 35: Mineral Resources of the Tuvatu Gold Project (2014).

Resource Category		Indicated			Inferred		
Metrics		Tonnes	Grade	Ounces	Tonnes	Grade	Ounces
Cut off	Selection Criteria	t	Au g/t	Au oz	t	Au g/t	Au oz
1 g/t Au	Surface Mining Potential - Within 75m of surface	609,000	3.5	69,000	513,000	4.2	69,000
3 g/t Au	Underground Mining Potential - Below 75m of surface	839,000	9.3	251,000	1,278,000	10.1	416,000
Total		1,448,000	6.9	320,000	1,791,000	8.4	485,000

14.16.1 Notes to accompany resource statement:

- The Tuvatu project comprises three 'Special Prospecting Licences (SPL1283, 1296, 1465) which have total area of 10,565 ha, and for which Lion One has a 100% interest. The Tuvatu deposit itself is situated on SPL1283
- MA was provided with an export of Lion One's current drill hole database in MS Access format.
- Ian Taylor (AusIMM(CP)) of Mining Associates visited the property in February of 2014. Field exposures and numerous drill holes were examined during this visit, and an assessment was made of the procedures for logging, sample preparation, quality control and SG measurement.
- Two independent samples were collected, (drill core and out crop) both returned expected gold values
- The Tuvatu deposit consists of a number of zones of low sulphidation epithermal quartz veins and spatially associated stockworks. Most of the main veins are exposed and therefore have a well-understood geometry. The veins show minor variability in orientation both along strike and down dip.
- The majority of the mineralisation lies within two zones of veining; The Upper Ridges zone striking NS, which has extends of 700 m, and the Murau corridor striking EW, has extents of 400 m. Additional to these areas is the western lodes, striking EW for 200m. At the intersection of the Upper Ridges and Murau lodes occur the SKL veins which are smaller shallow southerly dipping veins.
- Estimation undertaken in Surpac, using ordinary kriging. (inverse distance squared and Nearest neighbour and gram m estimates were used as validation techniques)
- Kriging of 10 m x 10 m x 1 m blocks (2D grid). The 3D Block Model uses a 10 m x 10 m x 10 m block which considers vein orientations and drill pattern. (Approximately 1/3 in the drill spacing, in well drilled areas). Sub-blocking of 1.25 m x 1.25 m x 1.25 m approximating the selective mining unit. Cubic blocks were required to accommodate all vein orientations sufficiently. Ore loss and dilution have been applied to the vein; a minimum mining width of 1.2m is applied (@ 0 g/t Au).
- Experimental Variograms were generated in Surpac. Nuggets were generally moderate to low, ranging from 0.1 to 0.51, and the range of the variogram ranged from 20 m to 100m. Geometric Anisotropy was adopted in the plane of the vein and ellipsoid ratios applied to reflect directional variograms.
- Estimation parameters: Veins used a max of 12 samples; minimum sample number was set to 1. Search distances reflect variogram ranges - 25 to 100 m.
- Average dry bulk density is 2.61 for all rocks and within interpreted veins the average dry bulk density is 2.57. Tonnages are based on dry tonnes. No moisture readings have been recorded.
- No other variables were considered in this resource estimate.
- Vein wireframes were constructed empirically from drill hole intercepts greater than at 0.5g/t Au. Wireframes were generated from the mid-point of the drill hole intercepts, smoothed and gridded. Gold, vein thickness and gram m were estimated in 2D space, resultant grids were re-folded and expanded to the thickness of the vein. The resulting wireframe solids were used to constrain the individual veins in 3D space.
- High grade outliers within the vein composite data were capped. Veins with greater than 34 intercepts were individually assessed for outliers; grade caps were applied as appropriate and ranged from the 97.5 percentile to the 99 percentile. Veins with less than 34 intercepts were capped at the 97.5 percentile. m (thickness) were not capped. (gram m were capped)
- Global mean grades for estimated blocks and drill hole samples compared well.
- Ordinary kriging estimates were compared to nearest neighbour and inverse distance and gram m estimates, to assess the impact of data clustering and semivariograms.
- No reconciliation data is available for the Tuvatu project as no production records are preserved.

15 MINERAL RESERVE ESTIMATES

MA has not established a reserve for the Tuvatu mineral resource. Previous work by Emperor (Emperor, 2000) established a historic Probable Reserve of 269,000 ounces Au from 1,262,000t of ore grading 6.63 g/t Au, based on an Indicated resource of 211,000 ounces Au. A preliminary mine plan was developed by Emperor based upon this resource that would yield some 80,000 ounces per annum at a production rate of 400,000 tpa.

The mineral reserve estimate used by Emperor for their in-house 2000 preliminary feasibility study is historical in nature and should not be relied upon. MA have not verified or approved the reserve estimate. It should be further noted that the historical resource estimate used by Emperor as the basis of the preliminary feasibility study has been superseded by the NI 43-101 compliant resource estimate that is the subject of this report.

23 ADJACENT PROPERTIES

23.1 SPL1412 SABETO

(Golden Rim 75%, Mincor Resources NL 25%)

The Sabeto license is located directly north of the Tuvatu tenement block covering an area of about 110km² and covers the majority of the under-explored Navilawa Caldera (or Navilawa goldfield). The project which sits to the north and directly along strike from the Tuvatu gold project is considered prospective for similar high-grade epithermal gold mineralization.

Previous exploration by Mincor had established significant potential for bonanza grade epithermal deposits similar to the Tuvatu style deposit at the Banana Creek, Tuvatu North, Kingston and Vatume Hill prospects.

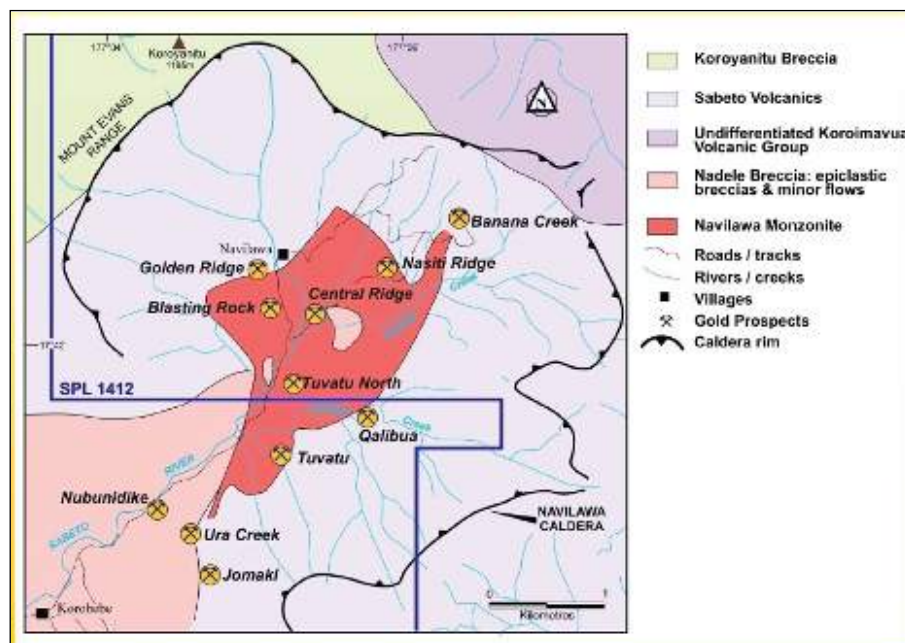

Figure 27: SPL1412 prospect locations
 Showing areal relationship to main Tuvatu prospects
 (Source: GRR 2007 Presentation)

During the 2008 year Golden Rim completed an additional 382m of diamond drilling in 2 holes to test for strike extensions of the high-grade Tuvatu gold resource at Tuvatu North. Significant quartz, carbonate and pyrite mineralization was intercepted in both holes. However assay results were disappointing, with a best intercept of 8.7 m @ 0.6 g/t gold obtained in drill hole TNDH 003.

Two major programs of geological mapping and geochemical sampling were completed at Sabeto. A total of 243 rock chips, 132 stream sediment samples and 394 soil samples were collected. High gold values were found in rock chips from two new prospect areas. A quartz vein float sample of 8.67 g/t gold was collected from Nagaga Creek to the south of the Central Ridge prospect. Significant rock chip results of 4.94 g/t gold and 2.35 g/t gold were obtained from float samples collected in Batiri Creek. These promising new areas lie midway between the Banana Creek prospect and the Tuvatu gold deposit. Follow-up work on these areas was planned for September 2008. Soil sampling produced a very high result of 17.3 g/t gold from the southern part of the Banana Creek prospect area. Ground checking of this sample located a 30cm-wide quartz vein. Rock chip sampling of this

structure returned an average grade of 1.87 g/t gold. The grade discrepancy between the soil and rock samples was not adequately explained.

In the Annual Report for the 12 months to 30 June 2009 Golden Rim state they have decided to divest its share of the Pacific gold projects (in both Fiji and Vanuatu) to concentrate further on the gold projects in Mali.

23.2 SPL1361 & SPL1368 (VUDA)

(Geopacific Ltd (subsidiary of GPR) 100% Sabeto and Option to Purchase 100% Vuda)

West of Tuvatu, Geopacific are exploring the Vuda Prospect targeting high grade vein style epithermal/mesothermal gold. The Vuda Project consists of two tenements SPL 1368 and SPL 1361 located directly west of the Tuvatu tenement block and covering an area of about 85km².

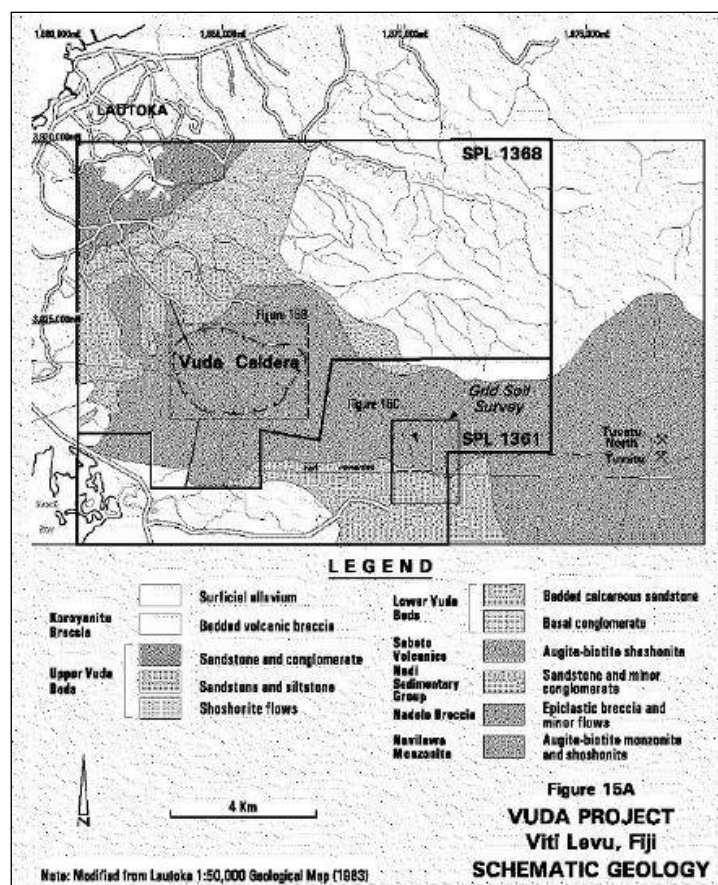

Figure 28: Vuda Project Location & Geology
(Source: GPR Prospectus)

Geopacific describe the Vuda Project as including three defined gold targets; Natalau Mine Area, Vuda Alteration Area and Sabeto, plus a substantial area of alteration with potential for additional discoveries (Geopacific Resources, 2005). Tuvatu is located 3km east of the boundary of SPL1361.

Exploration on the Sabeto/Vuda project has focussed on the search for buried gold-copper porphyry mineralization and Geopacific believes that Sabeto and Vuda have a high potential to host significant porphyry related gold-copper mineralization.

In 2012, three deep (235-400m) diamond drill holes were completed on the Sabeto Porphyry Project. Geology within the drill holes has confirmed observations made from surface mapping and sampling programmes that the Sabeto geology comprises a multi-phase monzonite intrusive stock

intruding volcanoclastic country rocks of the same magmatic source. The alteration and mineralization within the drill holes provide a vector toward potential porphyry-related gold-copper mineralization within an area around and to the south of SBDD001, with this drill hole displaying the most proximal alteration and mineralization assemblage. While mineralization in SBD001 is associated with syenite porphyry, it is thought that the actual mineralising porphyry phase remains undiscovered.

The area immediately south of drill hole SBD001 was to be the focus of exploration in 2013 with further detailed surface geochemistry being used to target several deep diamond drill holes to test the nature of the deeper mineralization

24 OTHER RELEVANT DATA AND INFORMATION

There is no other relevant data and information.

25 INTERPRETATION AND CONCLUSIONS

No further resource drilling has been conducted after October 2013, MA notes that the current drill hole database is reasonable and suitable for the use in the preparation of an independent NI 43-101 compliant resource estimate which is the subject of this report.

MA agrees with the conceptual model of narrow mineralised veins as provided by site geologists, identified intercepts were considered in section (EW or NS as required) to confirm vein orientation and projection, MA modified the vein names as appropriate to better define the vein orientations, thickness, grade and continuity.

The local geology is interpreted as a sequence of volcanoclastic units intruded by a monzonite intrusion complex with the narrow epithermal style vein mineralisation occurring as structurally controlled sets and networks of narrow veins and cracks within the monzonite host. Veins are narrow, generally less than 1 m up to a maximum of 7 m, and ore grades are erratic. This style of deposit is best developed as a selective (small mining equipment) open pit mine near surface and an underground mining operation targeting the high grade veins at depth. Mining will require significant geological control to direct development, controlling dilution and monitoring stope production.

A total of 39 different lode structures were identified in the resource area including

- 11 lodes in the Upper Ridges area, plus 1 split vein
- 4 lodes in the Murau area, plus 6 minor veins.
- 4 lodes in the West area, plus 2 minor veins
- 3 lodes in the Tuvatu area
- 8 in the SKL area.

The local geology is quite well understood from recent drilling and underground mapping, MA believes that structural complexities will be locally important and that tight geological control of production will be critical.

The local geology and structural information will be critical in the areas of the SKL veins as this is where the east-west Murau, north-south Upper Ridges and the SKL lodes come together. A detailed understanding of the local structures and geometries will be required.

MA previously noted the following issues (Vigar 2000) which are still applicable:

- The lode structures defined on the geological maps and assay plans were exposed in an exploration decline. Data obtained from the decline appears to generally agree with the drilling information at the exploration stage. This provides a reasonable level of confidence that the lodes have been modelled in a reasonable way. Without the actual numbers and sample locations, it is difficult to make an informed opinion on the drilling versus decline correlations regarding grade, width and location.
- An area of potential upside is that the exploration decline encountered smaller, local mineralized structures that were not thought to exist. Vigar identified other mineralized structures in the exploration decline that were considered too poorly understood to use in mineral resource estimation.
- Grade control drilling will be critical for mine planning. It has been noted in the decline that local splays and cross cutting lodes in the Upper ridges area caused 'confusion' regarding the location of UR2. Additionally, local offsetting and dilation of the lode due to shearing was noted. If selective mining methods are planned, these splays, cross cutting lodes and local

offsets will need to be well understood and modelled in order to plan the maximum extraction of economic mineralization.

Risks and uncertainties which may reasonably affect reliability or confidence in future work at Tuvatu relate mainly to the reproducibility of exploration results (i.e. exploration risk) in a production environment. MA believes the exploration risk to be low due to the historical identification of mineralization and decline development. There is a very low risk in terms of access, title or ability to perform future exploration and development work for statutory reasons.

26 RECOMMENDATIONS

The following recommendations have been made after this review of the technical data on the Tuvatu Gold Project:

- Continue exploration work, both surface channel sampling and mapping, particularly in areas where veins outcrop, and areas amenable to open pit mining.
- As Lion One intends to develop a mine at the Tuvatu Project, exploration drilling should continue at a measured pace to improve understanding of vein locations and local structural complexity.
- Dewater the decline
- Emperor completed a feasibility study in 2000. Lion One should update the financials and finalise the approvals process with the MRD.

27 DATE AND SIGNATURE PAGE

This report titled "INDEPENDENT TECHNICAL REPORT AND RESOURCE ESTIMATE ON THE TUVATU GOLD DEPOSIT" and dated effective 6 May 2014, was prepared and signed by the following authors:

Dated at Brisbane

6 May 2014

CERTIFICATE OF AUTHOR

Anthony Woodward

As co-author of the report Independent Technical Report and Resource Estimate on the Tuvatu Gold Deposit, Tuvatu Gold Project, Viti Levu, Fiji." Effective date May 6th 2014, I, Anthony Woodward do hereby certify:

I am a Principal Geologist of Mining Associates Ltd, Level 4, St Pauls Terrace Spring Hill, 4004, Queensland Australia. (Telephone +61 (0)7 3831 9154)

I hold the following academic qualifications:

B.Sc (Hons) Nottingham University, 1968; MSc James Cook University, 1976

I am a Member and certified professional geologist of the Australian Institute of Geoscientists and the Australian Institute of Mining and Metallurgy (# 104355) as well as a member of the Australian institute of Geoscientists. (#2688)

I have worked as a geologist in the minerals industry for 35 years.

I do, by reason of education, experience and professional registration, fulfill the requirements of a Qualified Person as defined in NI 43-101. My work experience in the minerals industry includes exploration management, technical services management at copper, gold exploration geology and mining operations roles at various levels. I have worked in a variety of different commodity styles, including epithermal gold, porphyry gold-copper-molybdenum, sediment-hosted copper, granite-related tin-tungsten, intrusion related gold, heavy mineral sands and alluvial gold and tin.

Those sections of this report for which I am responsible have been compiled in accordance with NI 43-101

I am responsible for the preparation of sections 2, 3 to 10 and 16 to 24 of the technical report.

I visited the Tuvatu project site several times in the period between 1995 and 2001 while employed by Emperor Gold Mining Company Ltd.

I am independent of Lion One Metals Pty Ltd as defined by NI43-101.

Dated this 6th day of May 2014

Anthony Woodward BSc (Hons), M.Sc., MAusIMM, MAIG

CERTIFICATE OF AUTHOR

Ian A Taylor

As co-author of the report Independent Technical Report and Resource Estimate on the Tuvatu Gold Deposit, Tuvatu Gold Project, Viti Levu, Fiji." Effective date May 6th 2014, I, Ian A Taylor do hereby certify:

I am a Principal Resource Geologist of Mining Associates Ltd, Level 4, St Pauls Terrace Spring Hill, 4004, Queensland Australia. (Telephone +61 (0)7 3831 9154)

I hold the following academic qualifications:

BSc (Hons) James Cook University, 1993

I am a member and certified professional geologist of the Australian Institute of Geoscientists and the Australian Institute of Mining and Metallurgy (# 110090) as well as a member of the Australian institute of Geoscientists. (#3069)

I have worked as a geologist in the minerals industry for 20 years.

I do, by reason of education, experience and professional registration, fulfill the requirements of a Qualified Person as defined in NI 43-101. My work experience in the minerals industry includes resource geology, production geology in open pit and underground mines and exploration roles. I have experience in a range of commodity styles including orogenic gold, epithermal gold and silver, porphyry copper-gold-molybdenum, komatiitic nickel sulphide and intrusion related gold.

Those sections of this report for which I am responsible have been compiled in accordance with NI 43-101

I am responsible for the preparation of sections 1, 11, to 15, 25, 26 and 27 of the technical report.

I visited the Tuvatu project site during the period 25th to 28th February 2014

I am independent of Lion One Metals Pty Ltd as defined by NI43-101 and have had no prior involvement with Tuvatu Gold Project.

As of the date of this certificate and as of the effective date of the Technical Report, to the best of my knowledge, information and belief, the Technical Report contains all scientific and technical information required to be disclosed to make the report not misleading.

I consent to the filing of the Technical Report with any stock exchange and other regulatory authority and any publication by for regulatory purposes, including electronic publication in the public company files on their websites accessible by the public, of the Technical Report.

Dated this 6th day of May 2014

GLOSSARY OF TECHNICAL TERMS

This glossary comprises a general list of common technical terms that are typically used by geologists. The list has been edited to conform in general to actual usage in the body of this report. However, the inclusion of a technical term in this glossary does not necessarily mean that it appears in the body of this report, and no imputation should be drawn. Investors should refer to more comprehensive dictionaries of geology in printed form or available in the internet for a complete glossary.

“200 mesh”	the number of openings (200) in one linear inch of screen mesh (200 mesh approximately equals 75 microns)
“Au”	chemical symbol for gold
“block model”	A block model is a computer based representation of a deposit in which geological zones are defined and filled with blocks which are assigned estimated values of grade and other attributes. The purpose of the block model (BM) is to associate grades with the volume model. The blocks in the BM are basically cubes with the size defined according to certain parameters.
“bulk density”	The dry in-situ tonnage factor used to convert volumes to tonnage. Bulk density testwork is carried out on site and is relatively comprehensive, although samples of the more friable and broken portions of the mineralized zones are often unable to be measured with any degree of confidence, therefore caution is used when using the data.
“cut-off grade”	The lowest grade value that is included in a resource statement. Must comply with JORC requirement 19 “ <i>reasonable prospects for eventual economic extraction</i> ” the lowest grade, or quality, of mineralized material that qualifies as economically mineable and available in a given deposit. May be defined on the basis of economic evaluation, or on physical or chemical attributes that define an acceptable product specification.
“diamond drilling, diamond core”	Rotary drilling technique using diamond set or impregnated bits, to cut a solid, continuous core sample of the rock. The core sample is retrieved to the surface, in a core barrel, by a wireline.
“down-hole survey”	Drillhole deviation as surveyed down-hole by using a conventional single-shot camera and readings taken at regular depth intervals, usually every 50 m.
“drill-hole database”	The drilling, surveying, geological and analyses database is produced by qualified personnel and is compiled, validated and maintained in digital and hardcopy formats..
“g/t”	grams per tonne, equivalent to parts per million
“g/t Au”	grams of gold per tonne
Gram x m (g.m)	Gram m are the grade of an assay multiplied by the length of the assay, this is the estimated variable, the grade can be back calculated by dividing the estimated gram m by the thickness
“gold assay”	Gold analysis is carried out by an independent ISO17025 accredited laboratory by classical ‘Screen Fire Assay’ technique that involves sieving a 900-1,000 gram sample to 200 mesh (~75microns). The entire oversize and duplicate undersize

	fractions are fire assayed and the weighted average gold grade calculated. This is one of the most appropriate methods for determining gold content if there is a 'coarse gold' component to the mineralization.
"grade cap, also called top cut"	The maximum value assigned to individual informing sample composites to reduce bias in the resource estimate. They are capped to prevent over estimation of the total resource as they exert an undue statistical weight. Capped samples may represent "outliers" or a small high-grade portion that is volumetrically too small to be separately domained.
"inverse distance estimation"	<p>It asserts that samples closer to the point of estimation are more likely to be similar to the sample at the estimation point than samples further away. Samples closer to the point of estimation are collected and weighted according to the inverse of their separation from the point of estimation, so samples closer to the point of estimation receive a higher weight than samples further away.</p> <p>The inverse distance weights can also be raised to a power, generally 2 (also called inverse distance squared). The higher the power, the more weight is assigned to the closer value. A power of 2 was used in the estimate used for comparison with the OK estimates.</p>
"JORC"	The Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves, 2004 (the "JORC Code" or "the Code"). The Code sets out minimum standards, recommendations and guidelines for Public Reporting in Australasia of Exploration Results, Mineral Resources and Ore Reserves. The definitions in the JORC Code are either identical to, or not materially different from, those similar codes, guidelines and standards published and adopted by the relevant professional bodies in Australia, Canada, South Africa, USA, UK, Ireland and many countries in Europe.
"JORC Inferred Resource"	That part of a Mineral Resource for which tonnage, grade and mineral content can be estimated with a low level of confidence. It is inferred from geological evidence and assumed but not verified geological and/or grade continuity. It is based on information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drillholes which may be limited or of uncertain quality and reliability.
"JORC Indicated Resource"	That part of a Mineral Resource for which tonnage, densities, shape, physical characteristics, grade and mineral content can be estimated with a reasonable level of confidence. It is based on exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes. The locations are too widely or inappropriately spaced to confirm geological and/or grade continuity but are spaced closely enough for continuity to be assumed.
"JORC Measured Resource"	That part of a Mineral Resource for which tonnage, densities, shape, physical characteristics, grade and mineral content can be estimated with a high level of confidence. It is based on detailed and reliable exploration, sampling and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes. The locations are spaced closely enough to confirm geological and grade continuity.

<p>“kriging neighbourhood analysis, or KNA”</p>	<p>The methodology for quantitatively assessing the suitability of a kriging neighbourhood involves some simple tests. It has been argued that KNA is a mandatory step in setting up any kriging estimate. Kriging is commonly described as a “minimum variance estimator” but this is only true when the block size and neighbourhood are properly defined. The objective of KNA is to determine the combination of search neighbourhood and block size that will result in conditional unbiasedness.</p>
<p>“lb”</p>	<p>Avoirdupois pound (= 453.59237 grammes). Mlb = million avoirdupois pounds</p>
<p>“micron (μ)”</p>	<p>Unit of length (= one thousandth of a millimetre or one millionth of a m).</p>
<p>“Mineral Resource”</p>	<p>A concentration or occurrence of material of intrinsic economic interest in or on the Earth’s crust in such form, quality and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade, geological characteristics and continuity of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories when reporting under JORC.</p>
<p>“nearest neighbour estimation” “Inferred”</p>	<p>Nearest Neighbour assigns values to blocks in the model by assigning the values from the nearest sample point to the block attribute of interest. that part of a Mineral Resource for which tonnage, grade and mineral content can be estimated with a low level of confidence. It is inferred from geological evidence and assumed but not verified geological and/or grade continuity. It is based on information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drillholes which may be limited or of uncertain quality and reliability.</p>
<p>“ordinary Kriging estimation, or OK” “Indicated”</p>	<p>Kriging is an inverse distance weighting technique where weights are selected via the variogram according to the samples distance and direction from the point of estimation. The weights are not only derived from the distance between samples and the block to be estimated, but also the distance between the samples themselves. This tends to give much lower weights to individual samples in an area where the samples are clustered. OK is known as the “best linear unbiased estimator. The kriging estimates are controlled by the variogram parameters. The variogram model parameters are interpreted from the data while the search parameters are optimised during kriging neighbourhood analysis.</p>
<p>“oz”</p>	<p>Troy ounce (= 31.103477 grams). Moz = million troy ounces</p>
<p>“QA/QC”</p>	<p>Quality Assurance/Quality Control. The procedures for sample collection, analysis and storage. Drill samples are despatched to ‘certified’ independent analytical laboratories for analyses. Blanks, Duplicates and Certified Reference Material samples should be included with each batch of drill samples as part of the Company’s QA/QC program.</p>
<p>“RC drilling”</p>	<p>Reverse Circulation drilling. A method of rotary drilling in which the sample is returned to the surface, using compressed air, inside the inner-tube of the drill-rod. A face-sampling hammer is used to penetrate the rock and provide crushed and pulverised sample to the surface without contamination.</p>

"survey"	Comprehensive surveying of drillhole positions, topography, and other cadastral features is carried out by the Company's surveyors using 'total station' instruments and independently verified on a regular basis. Locations are stored in both local drill grid and UTM coordinates.
"t"	Tonne (= 1 million grams)
"variogram"	The Variogram (or more accurately the Semi-variogram) is a method of displaying and modelling the difference in grade between two samples separated by a distance h, called the "lag" distance. It provides the mathematical model of variation with distance upon which the Krige estimation method is based.
"wireframe"	This is created by using triangulation to produce an isometric projection of, for example, a rock type, mineralization envelope or an underground stope. Volumes can be determined directly of each solid.

APPENDIX 1: LIST OF TAGGED VEIN INTERCEPTS:

The vein tag XXXX is mineralisation not assigned to any vein.
